THE date was a certain 3d of July, when the present century was some forty years younger than it is now. The moon was rising in unclouded brightness when Miss Maria Granby, having seen that the preparations for supper were duly completed, entered the drawing-room, carrying a lighted lamp in her hand, and then, to her surprise, perceived that the vicar was sitting alone in the dusk.

'Dear me, brother, where can Agnes and

Wilmot have run off to?' she said. 'I left them sitting on the sofa not a quarter of an hour ago, and now'—

'I don't know, I'm sure, my dear,' replied Mr Granby, rousing himself from one of those reveries which of late had become habitual with him. 'I was under the impression that they were sitting there still.'

Miss Granby without more ado took up the skirts of her dress and passed through one of the French-windows, determined to go in quest of the missing ones. 'Surely,' she said to herself, as she returned for her pattens, for which old-fashioned articles she entertained a private predilection, as being good for the constitution in damp weather—'surely Wilmot can never have been foolish enough to trail that girl down to the river and the grass as wet as it is!' With that she clumped away through the moist shrubbery, accompanied by Tiny, a favourite cat, who, being in a moonstruck mood, bounded on with elevated tail in front of her mistress, and then stopping to munch grass till she came up, rubbed against her feet, gave utterance to a plaintive mew, and scampered off as before.

Mr Granby, sitting with a faint smile hovering round his mouth, and one finger inserted between the leaves of a calf-bound volume of sermons, was left alone in the lamp-lighted room.

Meanwhile, the fugitives had wandered slowly through the meadow which skirted the vicarage garden, and now stood, two lithe and youthful figures, watching the 'gleaming river seaward flow from the inner land,' and listening to its dreamy slumberous murmur, but with very opposite feelings. To the ears of the girl it sounded like a mournful valediction whispered by the water-sprites, for she and Wilmot were to part to-night, and her sinking heart responded 'farewell,' and tears sprang to her eyes, so that the moon looked blurred and dim. To Wilmot Burrell it sounded like the far-off murmur of the distant ocean over whose waters he was so soon to wander; and if any thought of his approaching separation from her he loved, or believed he loved, crossed his mind, it was but as a transient shadow which left no impression behind. 'You'll think of me sometimes when I'm far away, won't you, darling?' he asked as he drew Agnes's arm closer within his own and turned towards the house.

'How can you ask!' she said with a trembling voice in which there was a faint ring of reproach. 'You know that I shall think of you very, very often.'

'I knew you would before I asked; but I can't have the sweet assurance too often from your lips.'—Then to himself: 'Confound it all! I quite forgot to call at the *Red Lion* this afternoon for that half-box of Cubas which the land-lord promised me. It's an awful nuisance. Too late now, of course, to fetch it.'

They paced in silence for a little while, then Wilmot said: 'And you'll write me lots of letters, won't you, dear? Never mind my short

ones. You don't know under what disadvantages a fellow writes on board ship—so much to distract his attention—so many duties to attend to—so little time to himself, that it's almost Love's labour lost to attempt it.—Why, you are quite melancholy to-night. Cheer up, little one. Two years will soon pass away, and then— But here comes aunty in search of us, so now we may look out for squalls.'

But Wilmot was mistaken, for Miss Maria, who would probably at any other time have scolded them as heartily as she knew how, which at the best was but poorly, remembering that he had but two more hours to stay with them, was too much melted by the thought to be more than mildly cross, and was, indeed, more inclined for tears than aught else. 'Come in, you foolish children, do!' she exclaimed with a little quaver in her voice. 'You will catch your deaths of cold, and supper will be quite spoiled—though neither of you deserves any, after running away in this fashion.'

'Don't say that, *ma chère marraine*,' replied Wilmot gaily. Then with a sigh, which, however, had nothing of sadness in it: 'Ah! many's the rough supper I shall have before I set eyes on either of you again.'

On reaching the vicarage they found Mr Granby slowly pacing the room with his hands behind him—a tall, fine-looking old man, but with an indefinable something in his expression which seemed to betoken a certain vacillation of purpose and infirmity of will.

Supper was soon over, for they were all too preoccupied to eat much. At the conclusion of the meal, Mr Granby, having drawn the cork of a bottle of his choicest port, an operation he would entrust to no hands but his own, arose, glass in hand. 'I drink,' said he with much solemnity, pushing up his spectacles on his forehead, 'to the health of the son of my oldest friend—to Wilmot Burrell. May he have a safe and prosperous voyage, and may we all be here to receive him on his return!'

Wilmot made a neat, sailor-like speech in reply, in which, after referring to the days of his childhood, all the recollections of which, he said, had reference in a greater or lesser degree to the persons then present and to the old house in which they then were, he alluded briefly to the prospects of his manhood, and hoped, in conclusion, that a new and a sweeter tie would in a little while bind him still closer to those whom he had loved and honoured from his youth upward. There was a brief silent pause after he sat down, which was pregnant with pathos to all there except to the young man himself.

And now Miss Maria became restless and uneasy, referring frequently to the timepiece, and listening intently for the slightest noise from without, for fear Wilmot might miss the night-coach by which he was to travel, although quite aware that it was not due for another half-hour. Presently she left the room for the purpose of satisfying herself that Wilmot's luggage had been brought down into the hall and was all properly labelled. Then the vicar took up his soft felt hat and went for a moonlight stroll on the veranda, and the two young people were left alone.

'Let us go into the drawing-room,' said Wilmot. 'I want you to sing me *The Murmur of the Shell*

and one or two other favourites, which will haunt my memory when I am far away.'

So Agnes seated herself at the piano and began to sing, while Wilmot bent over her and turned the music. One of his hands rested caressingly on her shoulder, and now and then his lips lightly touched her hair. But before long the striking of the clock warned them that in ten minutes more the coach would be due, and the same warning note brought back the vicar and Miss Maria.

The latter brought with her a long worsted comforter of divers colours, her own handiwork, with which she proceeded to envelop Wilmot's throat and chest, and succeeded in tying it in an inextricable knot behind, notwithstanding his laughing resistance and a pathetic request that she would not make such a 'guy' of him. Then the good old man drew Wilmot to his side on the sofa, and taking one of his hands in both his, he addressed to him a few last words of kindly counsel and admonition. The young man listened with downcast eyes and a half-smile, wondering within himself why elderly people should nearly always be so much more prosy and tiresome than young ones. It was a relief to him when the sound of the distant horn put an end to the vicar's monologue. Juxon, the vicar's man, had already wheeled the luggage to the gate, and our friends now followed it, Miss Maria with a little white shawl pinned over her faded curls, to keep the night-air off. As they walked down the garden path, she pressed into Wilmot's unreluctant hand a silk purse of her own making—not an empty purse by any means. She was his godmother, and as he had lost both his parents when quite young, she had always looked upon him as being in some sort her own especial property. The coach came rattling up. There was a last hand-shake for the vicar, a hearty kiss for Miss Maria, a more lingering one, or it may be more than one, for Agnes, with a whispered, 'Do not forget me, darling, and write as often as you can;' and then Wilmot leaped blithely up beside the driver. A wave of the hand, a crack of the whip, a blast from the guard's bugle, and they were off—off, melting gradually into the summer darkness and seeming to become a portion of it, then detected by the ear alone, till that, too, failed and silence claimed its own again. Silently and sadly the three who were left went back to the house, over which a shadow seemed already to have fallen. Already they missed Wilmot's light-hearted laughter and the fresh brightness of his handsome face.

Little inclined for sleep was Agnes when she went to her own room. The moon threw its broad silver beams into her chamber, and the spirits of the night seemed to whisper sadly at the casement—one dear name. She blew out her candle and sat down on the low window-seat. All things spoke of him: the old summer-house, dimly discerned, where they had spent so many happy hours; the quivering poplars, up which he had climbed when a boy; the distant river, on whose banks they had so often wandered. She gazed and gazed, immersed in a thousand memories, till she lost all sense of time and place. Her spirit flew forth into the night to embrace his, pursuing him, swift as Ariel's self,

along the road he had gone. And not on that night alone, but on many after nights, when the winds were high and the black waters troubled, did she wander forth in fancy through the waste of darkness in search of him she had lost.

Wilmot, meanwhile, was being whirled rapidly along towards his destination. He happened to be the only outside passenger, and in ten minutes after taking the box-seat he and the driver had become the best of friends. Both driver and guard must help themselves out of his cigar case, and as often as they stopped to change horses, each of them must have a glass of 'something hot' at his expense. Wilmot dearly loved to play the part of Don Magnifico in his little way.

The coach drew up in Dale Street, Liverpool, next morning as the clocks were striking six, by which time the young man was pretty well 'slewed up' as he termed it; so he made his way at once to the *Crooked Billet* in Exchange Street East, where he ordered a bed and slept till four o'clock in the afternoon. He arose in the best possible humour with himself and everybody. He had examined the contents of Miss Maria's purse, which proved more valuable than he had expected; so, as he was to sail in the course of a few days and could not make sure of another evening to himself, he decided to seek out a couple of friends, whom he would treat to a first-rate dinner and a box at the theatre afterwards. Hang the expense! the little purse would stand it all.

He had not forgotten Agnes—by no means. He often thought of her, and always with a little self-satisfied smile playing round his mouth. By Jove! what a lucky fellow he was. Here was a girl, as pretty as you would see in a day's walk, who loved him with all the fervour of her fresh young heart, and had promised to wait till he should be in a position to marry her—a girl with good expectations, too, which made matters all the pleasanter. What with his living and his private income, the old vicar must be decidedly 'warm,' and he did not look like a man who would trouble this world many years longer. Wilmot Burrell felt that he would have given much for a peep at Mr Granby's banking account.

THE RAT.

THE rat has earned for himself the reputation of being one of the most sagacious of four-footed creatures; and we are of opinion that he has fairly earned it. That he is exceedingly sharp and cunning, we have had manifold opportunities of proving to our cost. Not seldom have we found, when he was bent on evil courses, that it took us all our time to outmanœuvre him, and sometimes we have been compelled to acknowledge defeat.

We live in the country, where we cultivate a small farm; and the outhouse premises, drains, hedgerows, and shrubbery close by have been found comfortable homes and convenient shelters for these destructive rodents. Sometimes they literally swarm everywhere; sometimes very few are about; and on several occasions we have

been successful in banishing them altogether for several months. From what we have observed, we cannot doubt that it is not an unusual thing for them, when the conditions of life are adverse, to change their quarters *en masse*. And this is not always explainable on the ground of a failure of food supplies; rather some grand catastrophe, or the anticipation of it, would appear to be the cause of migration. One time a fire had been kindled under a boiler in an outhouse. A big rat had evidently been prowling about, and had sought temporary refuge and concealment in the smoke-flue. Very soon, however, he found his hiding-place getting too warm for him; the heat forced him to attempt an escape; but the only possible outlet was through the rapidly kindling flames. It had to be done, however; and at last he made the rush, right through the fire and smoke, and escaped. We cannot say whether he was badly burned or only slightly singed, or if he survived the fiery ordeal; but certain it is from that day for fully six months not a rat was seen or known to be about the premises. This would also go far to prove the accuracy of the observation often made, that rats are so afraid of fire, that even the smell of singeing will terrify them into 'making tracks.'

On another occasion we got quit of an army of these troublesome neighbours in a curious way. They had drilled a hole in an outhouse floor just over a cross rafter beam. This opened a passage to the granary, and they were obviously having fine times of it amongst the grain. Our boy dearly loves the hunt and sport of every description, and he is withal of a very ingenious turn of mind. Here was an opportunity for displaying his inventive genius, which he determined to improve. Hearing us make some hostile remarks about the thieves, he carefully examined the hole; then came to us with a very determined air and said: 'Father, the first rat that dares to come through that hole shall die; you see if he doesn't. And if he is the father of all the rats, teaching the others to steal, which is most likely, all the better.'

'Very well,' said I, highly amused. 'Try what you can do; but most probably you will be defeated. The rats are very cunning animals.'

'I know they are,' was the prompt reply; 'but I am cunning too.'

He did not tell us his plan: he was going to surprise us; and feeling himself put upon his mettle by our bantering challenge, he was determined not to be baffled. This was how he set to work. To one end of a piece of lancewood about two feet long—the remains of a broken bow—he firmly attached, at right angles, a short skewer, sharpened to a fine point. The other end of the lancewood he nailed securely to the floor—thus extemporising a sort of spring of sufficient strength and elasticity for his purpose. The point of his arrow he supported right above the rat-hole by a little bit of loose wood an inch broad, in such a way that there was no possibility of a rat crossing the beam or coming up through the hole without displacing this supporting pin and freeing the arrow, which the elasticity of the bow would drive home, and so slay any rat that might be foolhardy enough to dare the passage. All being carefully arranged and fixed up before evening, the result was

watched and waited for with intense interest, the proceedings being in the meantime kept a secret from us. Some little time after darkness had fallen, we were sitting in our room reading, when our boy rushed in, in a state of frantic excitement, and a little pale, we thought.—‘The rat!’ he cried. ‘Come, quick, quick! I don’t know what to do.’

We followed him with a lantern; and there, sure enough, was a monstrous fellow transfixed to the beam, and screaming fearfully in his agony. We felt at a loss what to do. It was impossible to haul him out and despatch him. But we could not bear to hear the pitiful cries of the writhing prisoner, so we hurriedly pulled up the skewer, and he disappeared. As far as we could judge, he had been pierced through one of his hind-legs. Whether or not the wound proved mortal, we could not tell; but we came to the conclusion that he must have been a leading and influential member of the tribe, and doubtless advised a change to safer quarters; for not a rat troubled us for months after that, and our young hopeful was abundantly satisfied with the result of his stratagem.

Rats are certainly very destructive to grain both in stack and in the granary; but their ravages amongst young poultry are more obtrusively apparent, and consequently more provoking. We have observed, however, that some seasons, although they are known to be numerous about the premises, they don’t attack the young birds; while at other times their persistent onslaughts render it exceedingly difficult to rear a single brood without half or all of it falling a prey to their voracity. We take it that, birds not being their natural food, they don’t always find out they are so easily killed, and withal so toothsome; but when some old and powerful chief of the tribe, perhaps half accidentally, through falling in with a dead or weakly bird, makes the discovery, the rest follow his lead in the work of slaughter; and then the broods are despatched without stint or mercy. It is curious that the mother-bird seems to be no protection whatever. She will fly furiously at dogs or cats, if they come near or attempt to molest her; and she will with great courage—as we have more than once witnessed—repulse the attacks of hooded crows and even ravens. But the rats don’t mind her a bit; at anyrate, they are not beat off by her, but carry on their depredations in contempt of her. And yet one would think a hen’s powerful beak might prove a not ineffective defence if properly used.

As a general rule, dogs and cats are not of much use in destroying these pests. We have a fine Skye terrier with a splendid nose for rats, and inspired with a great love of sport. The hens’ court is surrounded by a tall thick hedge, at the roots of which there are not a few rat-holes. Master ‘Scamp’ is aware of this, and often watches for the ‘varmin’ for hours after the manner of cats. Occasionally, he is successful when some enterprising rat ventures forth to claim a share of the hens’ food or of pickings that may be scattered about; but generally, the cunning rat makes sure, even if at some distance from his hole, to be near enough the hedge to secure a safe retreat. On the least alarm or movement, if he cannot reach his hole, he rushes to the hedge and runs up into the branches, where he hides amongst the leaves, and

can laugh at Scamp’s furious barking and challenge to come down if he dares; and he takes good care not to leave his place of safety and concealment until the coast is clear.

As to cats, some of them are good ratters, and when they are, they are invaluable; but, as a general rule, they will scarcely look at a rat, and evidently don’t regard them as their proper prey. A short time ago we witnessed, at a friend’s house, a curious incident, illustrative of the sagacity and prompt fertility of resource of a grand old rat. He had somehow got into a large empty barrel, but could not leap out, and had not had time to gnaw his way out before he was discovered. My friend had a fine large cat, ‘Muffin,’ a capital mouser, but not a ratter. Here, thought Mr B——, was a fine opportunity of forcing on the combat; and perhaps, if Muffin once got a lesson, he might develop a taste for rat-hunting; so he was dropt into the barrel. Manifestly, however, he did not approve of this mode of procedure, and sprang upwards. The old rat was equal to the occasion. Muffin’s forepaws had scarcely touched the edge of the barrel, when, quick as thought, and with admirable promptitude, he made a spring on to Muffin’s back, and ran right over him; and would to a certainty have escaped but for another enemy close by in the shape of a great St Bernard dog that was sitting watching the proceedings with interest. Right into his capacious jaws the unfortunate rat leaped, and there was of course an immediate end of him. That rat deserved a better fate.

We have tried every description of rat-trap we could lay hands on, but have found them all unsatisfactory. Occasionally, a single rat may be caught; but the others take note, and are not to be tempted by the most seductive bait; nor are their suspicions lulled by very cunning devices. We have set traps carefully concealed round the outlet of their holes in such a manner that we did not think it possible they could pass without being caught. But somehow they did; or they had some other outlet which they utilised.

Last year we were fairly put on our mettle. We had a fine brood of valuable chickens which we were watching and cherishing with great solicitude. They were about three weeks old. No attack had been made upon them, and we were in hopes it was going to prove a season of exemption. We were rudely awakened from our pleasant dreams. One morning five of our best chickens had disappeared. Our old enemies, we found, had been at work and begun their depredations. They had gained access by scraping a hole in the hard soil under the edge of the coop. It was plain we must devise some means of excluding the robbers. Meantime, we transferred ‘Amelia,’ the mother-hen, and the remainder of her brood to a small outhouse, to which there was no access even for a rat, and locked the door, which was strong and closely fitted. What was our dismay next morning to find the audacious burglars had with their sharp teeth drilled a hole through the door at one corner and devoured or mangled every one of the chickens! Amelia was left lamenting. We were thoroughly roused. In our wrath we vowed vengeance, and resolved it should be such as would teach the tribe a lesson they would not soon forget. Long we

pondered over the situation. All ordinary methods, we knew, would prove of little avail. We must try something novel; we must invent a new species of trap more deadly than any with which we were acquainted.

We shall endeavour to describe our invention and the plan we adopted. We made a narrow box just long enough to reach across the top of an empty herring-barrel, and about eight inches broad, and the same deep. The lid of the box we nailed down, except eight inches at one end, which was open. Right underneath this opening, and of the same size, we fitted a sort of trap-door, adjusted with a species of pivot hinge, balanced in such a way that it yielded to the slightest weight when dropt on it, but immediately returned to its level position. Our object will be apparent. The rats must not suspect that this part of the bottom of the box was less secure than it seemed, until they sprang down on it and found out, when too late, its treacherousness. At one end of our stable there is a loose horse-box, seldom used, except by the rats, which find it a convenient place for holding their midnight revels, and from the manger of which, on the approach of danger, they have an easy passage to a loft and to their secret and safe retreats. Here, close to the manger, we set the barrel, into which we poured a couple of buckets of water. We then adjusted the box, nailing pieces of board at both its sides across the uncovered top of the barrel, to hide the inside from the keen eyes of our destined victims. Thoroughly to lull their suspicions, we judged it expedient to bolt up the trap-door and feed them for a few days. We therefore put into the box a goodly supply of highly flavoured viands peculiarly tempting to rat palates—bits of old cheese, fat of roast beef, and such-like.

For five days they were proof against the temptation, and we had almost begun to fear we were going to be balked. However, we waited patiently, and on the sixth morning we were not a little satisfied to find that all the contents of our box had disappeared. We suppose the wary old members of the tribe regarded the whole apparatus with suspicion, and declined a closer inspection, lest they should come to grief, until some adventurous young brave led the way. Finding he came to no mishap, and all being apparently quite safe, the others would follow. For several days we still continued to introduce into the box fresh supplies of food, which each morning disappeared. When we were satisfied that all suspicions were completely lulled, we drew the bolt of the trap-door and anxiously awaited the result. Next morning, we had the pleasure of fishing up no fewer than twenty-two rats of various sizes which had found a watery grave in the barrel. Dead rats tell no tales; and the survivors, although they might, and no doubt did, miss their companions which had so miserably perished, could not see, and apparently did not understand, the manner or cause of their disappearance, and did not suspect, until too late, the little box from which they had enjoyed so many delightful feasts. Two days afterwards we found that twelve more had made the grand plunge which had proved so fatal to their kindred. We don't suppose the whole colony was extirpated; we daresay a few survived; but they seemed to have been so struck with terror at the dreadful mystery of the disaster

which had befallen the tribe, that they made tracks, and we were no more troubled with them for the rest of the season. Amelia was amply avenged, and so were we.

WHO DID IT?

A STORY IN FOUR CHAPTERS.

CHAPTER II.

MARY returned early from the cricket-field, for her uncle might come back at any moment, and she knew that it irritated and put him out to find the house empty. He had not, however, returned, so she seated herself at the window, which looked over the neglected expanse of a once pleasant lawn, bounded by a ruddy old wall, about which clambered in unkempt profusion plums and pears and nectarines, and reviewed the events which were taking place in her little world. The result of an hour's meditation over Claude's not unnatural impatience and disappointment, and the state of affairs between her uncle and her brother, so evidently getting from bad to worse, was that she had a good cry, and was found with her face buried in her hands by Dick on his return from the match.

'Well,' she said with assumed sprightliness, 'and who won?'

'Oh, we beat 'em by five wickets.—You didn't see my smack, did you?'

'Your smack, Dick? Why, you haven't been hurt, have you?' asked Mary anxiously.

'No, no; I mean my hit. You know that the wickets were pitched closer up to the garden wall than usual. Well, they put on slows, and I got a half-volley to square leg which I couldn't resist, so I put all my beef into it and sent the ball spinning away over the wall. "Lost ball" of course it was, and I got six for it, for you might look for a week in the garden without finding a cricket ball.—Where's the old man?'

'He has not come back yet, and I'm getting anxious.'

'Oh, he's all right,' said her brother. 'Why, he'd stay away for a week on the chance of finding a lot of dirty old stones or a bit of broken pottery. Besides, he often goes away, stays later than he intended, and puts up at some fellow's house for the night.—But what are you crying about?'

'I'm not crying, Dick.'

'I'll swear you were when I came in, and your eyes are red now.'

'Oh, I think I'm a little put out, and perhaps I'm anxious about uncle—that's all.'

'Not you. That beggar Shute's been here. Lucky I wasn't in.'

'I think you are very unkind and unjust about "that beggar Shute," as you are pleased to call him; and I'm sure I don't know why.'

'Because I hate fellows of his kidney, poor as church mice, who come sponging and sneaking and cadging about for what they can get. He's already got round the old man, and he's got round you, and he's only got to get round me, and his artful game is won.—Now, if it was a chap like Jack Straddles of Pommel Hall, I'd say

nothing. He's the sort of man I'd choose for a brother-in-law; and he'd stand on his head for a week, with a little encouragement from you.'

'Mr Straddles is not a man to my taste. He has only got two topics—sporting and stables.'

'And two very good topics they are; better than rhymes and old stones and nigger languages and that sort of thing. All I can say is that Shute shan't be your husband with my consent.'

Mary's heart was full, and she was longing to speak up in vindication of her lover; but she knew that it would not only be fruitless, but that it would serve to anger her hot-headed brother still more against him; so she remained silent.

As Dick insisted, they did not wait dinner, and had a silent, uncomfortable sort of meal together; Dick being rather ill at ease, because he was perhaps conscious of having talked too freely and violently upon a matter which in reality was but of little concern to him; Mary unsettled and anxious on account of her uncle.

'If he is not home soon,' she said in reply to her brother's exhortations not to be silly about nothing, 'I shall be sure that there is something wrong. I know that formerly he used sometimes to stay away at night without having given us notice, but that was when he was stronger, and he has not done it for at least a year.'

Dick sauntered away after dinner to play billiards with a neighbouring Squireen. Mary hurried off down to the railway station to inquire if her uncle had gone by train anywhere, for she knew that if he had done as he intended, gone with the antiquaries, the distance was too far for him to walk.

In reply to her question, the station-master said that he had only issued a ticket to one gentleman, and that was to Mr Shute, who had gone to London by the three o'clock train.

So she hastened homewards again; but her uncle had not returned, and as it was getting dark, her anxiety became more intense. He was an old man, and it was quite possible that in order to save the train-fare he might have attempted to walk the five miles to Bury Hill; and that, in such a lonely part of the country, he might have been seized with a fit or have broken a blood-vessel without any one being near to help him.

Remain in the house alone in company with these and other dreads of a similar character she could not, so she sent a servant with a message to Mr Richard that he should come home at once.

Half an hour elapsed before Dick arrived, and he was in no gentle mood at being disturbed in his evening's amusement for what he considered the foolish whim of a nervous girl.

'Dick,' said his sister, 'I am sure there is something wrong. Uncle has never been out so late before without letting us know. I've been to the station, and he hasn't been there. No one has seen him about the village.'

'Well then,' said Dick, 'if he didn't go with the antiquarian Johnnies, and hasn't taken the train, and hasn't been seen in the village, he's somewhere about the grounds: there's plenty of room for him on fifty acres of land.'

'Perhaps at the old summer-house,' said Mary. 'Yes, yes; Dick, let us go and look.'

'The last place in the world where he'd go when there was a cricket match going on,' said

Dick. 'Why, he always swears he can't read a line or think because of the noise.'

But Mary was so resolved to go and look, that Dick got a lantern, and with his sister close at his heels for fright and nervousness, led the way through the bushes and thick undergrowth, silent and weird in the faint sickly light of the rising moon, towards the old summer-house.

A quarter of an hour's walk brought them to the summer-house, a tumble-down, rickety old structure, standing on a small open space amidst the trees, and facing a quiet pool of dark water which extended as far as the boundary-wall, some thirty yards distant, long since abandoned to rats and bats, but by reason of its solitude, much frequented by old Jethro Seaton, who often passed the long hours of an entire summer day here in company with a favourite volume from the dusky, dusty shelves of his library. The place barely stood together, for the thatched roof had peeled off in a dozen places, and the rats had burrowed holes all about the flooring; but old Jethro would not have it touched—from sentiment, he said—from motives of parsimony, it was generally believed.

The ray of lantern light thrown into the building showed a dark mass on the floor. Mary uttered a cry of horror, and in a moment was kneeling beside the helpless body of her uncle. Dick stood like a man in a trance, his wide-open eyes fixed on the inert heap, the lantern trembling in his hands.

'Dick, Dick!' cried the girl. 'He may not be dead! You must get help! As quick as you can; there may be a chance.—O uncle! my dear old uncle!'

Dick placed his hand on the white cheek, and shook his head. 'There is no chance,' he said in a low voice; 'he is as cold as marble. He must have had a fit, poor old uncle, for he has fallen sideways from the chair.'

'Dick, Dick!' whispered the girl, seizing his hand, 'it is a dreadful thought, but do you think there has been any crime committed?'

'Crime! You mean do I think he has been murdered? Certainly not. What earthly object could any one have in murdering a poor old harmless man like uncle? However, you stay here. I'll leave the lantern; I can find my way back easily enough. I'll get some men to help us take him into the house, and then I'll go for Dr Waller: he'll say at once what has been the cause of death.' So he started off, leaving Mary moaning and crying by the side of the body, and in a very short time returned with a couple of men, by whose aid it was carried into the house.

The doctor examined the body, and could find no traces of violence; but when he came to the head, he pointed out the wound behind the ear, that must have been the result of a tremendous blow, sufficient, he said, to have killed instantaneously a much younger and stronger man. It had not been such a blow as would have been caused in falling, he said, but a deliberately aimed blow. 'In short,' he summed up, 'I am afraid there has been foul-play, and it will be my duty to communicate my suspicions at once to the police.'

'My God!' exclaimed Dick, 'and I quarrelled with him to the very last!'

And the stalwart young athlete, who had never

shed a tear since his mother's coffin had been carried out of the house, threw himself into a chair and sobbed bitterly.

Mary was calm and quiet in her grief; so calm and quiet that her brother was surprised.

'Mary,' said Dick presently, 'we must not leave a stone unturned to come at the root of this. Who could possibly have done this?'

Mary was looking at him with a strange questioning look. Then she took his arm, and said: 'Dick, it is a horrible question, but I must ask it. Do you know anything about this?'

'I! I!' almost shrieked the young man.—'Mary, do you mean to ask me if I have done this? Oh no, no! But I shall be suspected; I know that. Every one knows of the quarrels between me and my uncle. Every one knows that I have an uncontrollable temper, and they will say that we had a quarrel, and that I struck him dead! But Mary, although you do think so badly of me, you do not believe that I could be capable of such a deed? Say that you don't!'

'Of course I believe you, Dick, and I don't think badly of you, as you say; but the thought did flash across me that perhaps uncle had met you coming from cricket, had reproached you for having left business, and that you had replied, and—— But no, you *could* not have done it, I am sure.'

'It is too late now to think of searching,' said Dick; 'but to-morrow, as soon as it is light, I will go down to the summer-house and look for some evidence of the murderer. Anything will serve as a clue—footmarks, something dropped in the hurry of flight, the smallest clue will be sufficient. And yet I cannot conceive who could have anything to gain by murdering one who, strange and unpopular as he might have been, never did harm to any one. Gain could not have been the object, for poor old Uncle Jethro was too careful to go about with anything worth robbing about him except his watch. We shall find that in the summer-house, I have no doubt, for you know he always used to read with it placed on the table beside him.' So they took a parting look at the poor body stretched on the bed in his own room, and having, according to local custom, placed four candles lighted in the room, turned the pictures with their faces to the wall, and reversed the looking-glass, betook themselves to such sleep as they could snatch under such terrible circumstances.

But one face haunted Mary throughout that long night—the face was that of Claude Shute, and on the dark brow she saw the deep brand of Cain.

OPIUM 'JOINTS' IN THE BLACK HILLS.

IN 1877 and 1878, when Deadwood, the metropolis of the Black Hills, one of the richest mining camps ever discovered in the United States, was over three hundred miles distant from the nearest railroad, it was ascertained that the Chinamen had introduced the vice of opium-smoking among the white inhabitants. I was employed at the time as Deputy-Sheriff, and received instructions to investigate the subject, with a view of closing the houses and punishing the proprietors.

While so employed, I discovered that there were no fewer than ten houses where smoking was in-

dulged in, and that these houses would accommodate over two hundred smokers at one time.—During all hours of the day and night they were well patronised, and because of the rough character of the majority of the population, the Chinese proprietors made but very little effort to hide the real nature of their business, although here, in common with other sections of the States, the laws against this traffic were very severe, but had never been enforced. However, the better class of the inhabitants realised that some effort to stop the vice was necessary, because the proportion of regular smokers, or 'fiends' as we styled them, was becoming so large as to cause scandal even among the reckless adventurous spirits found in the population of a rich mining camp. It was then I first saw the interior of a 'joint;' and if your readers will for a short time accompany me in their imagination, I will describe it.

From the outside appearance of the frame building we are approaching, and the sign 'Sin Lee Laundry,' this is only one of the numerous Chinese laundries which are established by the Celestials in every mining camp in the West. We step from the street into a small room entirely unfurnished, except by a short pine-board counter, on which is a pair of scales for gold-dust, and the counting-board used by all the Chinese to assist them in figuring. A small saw-toothed, almond-eyed Chinaman, with his queue twisted around on the top of his head, and dressed in a gaily coloured quilted silk robe with wide-flowing sleeves, wide trousers, and shoes peculiar to this race of people, stands behind the primitive counter, ready to attend to the wants of customers. He is not the proprietor, as we ascertain by inquiring for Sin Lee, which provokes the response: 'Him not here. What you wantee?' This is in accordance with his instructions, for these Chinamen are very 'cute, and never acknowledge that they are the particular ones you want until they ascertain the nature of your business; and in keeping up such a mystery they are ably assisted by nature, for all the men bear such strong likeness to each other, that unless a white man is really well acquainted with the particular Chinaman he wants to see, it is almost impossible for him to pick him out of a crowd of them. But a sign being given, and a half-dollar or sack of gold-dust placed on the counter, our Celestial friend produces a card, on which he places a very small quantity of opium, and calls an attendant to conduct us to a smoke-room.

We step from the little front office through a doorway into a passage, from both sides of which open several small doors. One of these being opened by the attendant, we find ourselves in a room or stall about six feet wide and seven long, and although the ceiling is low, yet the partitions do not reach to it on either side. The walls, floor, and ceiling are all plain pine-boards; no paper-hanger, plasterer, or painter has ever tested his skill in any part of this house; no decorator or upholsterer has ever found his services needed to furnish this infamous den, presided over by as low a grade of Chinamen as ever landed on American soil. The only furniture in the stall the attendant has thrown open is a bench built the entire length of the room, about five feet wide and four feet from the floor; on this is stretched an old piece of carpet; in each corner

is a dirty pillow, which has the appearance of being stuffed with a block of wood; while in the centre of the bench stands a small lamp, with an opium pipe and piece of steel, which looks like a knitting-needle, lying beside it. There is no sign of a window in the room; no light can penetrate it except through the door in the passage. The smell of stale opium-smoke is sufficiently oppressive to give a novice such a fit of sickness as could hardly be excelled by the rolling of an ocean steamer in a stiff gale. No fresh air has ever mingled itself with the fumes; no ventilation or comfort is asked for by devotees to this vice; for old smokers have told me that the fascination is so great, that after smoking only a few times, they have found it almost impossible to break themselves of the habit, which in many cases mere curiosity caused them to form.

To the uninitiated, the opium pipe is a puzzle, for it has not any similarity to a tobacco pipe. The stem is about twenty-four inches long, and as thick as a medium-sized walking-stick; while the bowl of the ordinary pipe in this case presents a flat polished surface about an inch and a half in diameter, with a small hole in the centre. If the smoker is a novice, the attendant takes a reclining position on one side of the lamp, while the victim occupies a similar position on the other. Now we discover the use of the knitting-needle, for the Chinaman takes a certain quantity of the black gummy opium from the card on to the steel point; this he holds in the flame of the lamp, twirling the other end gently between his thumb and finger until the opium melts. Then he dexterously places the melted mass on the flat surface of the pipe, with the steel point in the hole in the centre. This is called 'rolling opium;' and regular frequenters of the 'joint' soon learn to roll for themselves as dexterously as the Chinamen. The pipe is then handed to the smoker, who proceeds to draw the fumes through the stem in the same manner that a man smokes a pipe full of tobacco, except that the bowl or flat surface on which the opium was placed has to be kept in the flame of the lamp to keep the drug alight. A few whiffs, and the rolling operation has to be gone through again; and a few pipes—unless the smoker be an old hand—will send him to sleep, and to dream, as some have described it, pleasant fairy-like dreams.

One initiated in this vicious habit can tell as soon as he sees the smoker take the first whiff whether he be a novice or a regular 'fiend.' The novice will draw in short whiffs quickly; but the old-timer takes what is known as the 'long draw;' in other words, draws slowly, and inhales the fumes through his entire system; at the same time his face wears such a satisfied look as to give an onlooker the impression that he is in an enviable state of bliss. Once asleep under the influence of this poisonous drug, the 'fiend' is allowed to occupy the stall until he awakes without interference. On awaking, his sensations are not so pleasant as they were; he feels a pricking through his entire body, as though some one was sticking pins into him by the thousand. If it has been his first experience, he is likely to feel very sick, as a man who has just awakened after a carousal on liquor; and if he is sensible, he will never again 'hit the pipe,'

as is the expression used. But if he is a regular 'fiend,' in a space of a few hours at most he will retrace his steps to the 'joint,' there to smoke himself again into a state of unconsciousness.

Let us take a further look through this establishment, where the Chinamen are getting rich, at the expense not only of the pockets but of the heart's-blood of their white neighbours. Stepping into the passage from our stall, and opening the other doors as we walk, we see in each room one, two, three, and sometimes four 'fiends' of both sexes, either dreaming off the effects of the deadly drug, or else smoking. So far as noise is concerned we might be in a vast tomb, for opium affects the brain in an entirely different manner from whisky, and the victims are entirely harmless. It quiets all the passions instead of inflaming them, and this is one of the reasons why opium-smoking can be carried on to such an extent without detection, for the older the smoker the more secretive he becomes; and the laws are now so strictly enforced all over this country, that it would be a most difficult matter to obtain a view of the interior of any smoke-house. Indeed, even in that far-away mining camp, and at that time, when the population were careless of such crimes as gambling and others against the morals of society, we virtually put a stop to this traffic in a short time; for when those ignorant of the terrible effects of the drug learned how quickly it would rob a man of all semblance of manhood, the officers received such assistance as frightened the Chinamen at least sufficiently to make them very secretive in conducting the business.

INVENTIONS IN GAUGING.

GAUGING, as every one knows, is the means of arriving at the approximate gross quantity or 'contents,' as it is called, of liquid in casks. To all brewers and distillers, and importers or exporters of beer, wines, and spirits, correct gauging is a matter of moment. The government gauger is the officer of customs or of excise whose duty it is to discover the contents of the casks of dutiable goods, with the object of assessing the amount of duty to be levied. A trifling error in the calculation, or, rather, in the system of calculation, means many thousands of pounds per annum out of the pockets either of the mercantile community or of the Crown. If the mode of calculation unduly favours the Crown, the merchants suffer, and *vice versa*. Hence, it is essential that the mode of gauging the contents of casks, by which so many millions of revenue are assessed, should be as far as possible strictly accurate. The safest plan to arrive at the quantity in any given cask would be to draw the contents off, and so measure them; but this is a tedious process, and is an impracticable one where tens of thousands of casks have to be dealt with. It is obvious, therefore, that some system of measurement must be adopted without reverting to the primitive one of drawing off the contents.

In the excise service, the measurement is arrived at by weighing the contents. The excise has mainly to deal with one item of spirit only, termed British Plain Spirits, consisting of home-manufactured gin or whisky or British brandy.

The goods to be assessed being home-manufactured, it is easy to ascertain the measurement of casks by weighing the empty casks; deducting this, the weight of full casks gives the required contents. But this cannot be done by the customs officers, who have to deal with casks of all sizes and construction imported from abroad. Knowing nothing whatever of the weight (or tare) of these casks of imported brandy, rum, geneva, plain spirits, and wines when empty, the customs department has perforce continued to use the recognised system of gauging by external wooden calipers, from which one inch is cut off—gauging officers having to supply differences according to the thickness of the cask or peculiarity of figure—the latter a geometrical allowance, in point of fact, for want of symmetry. Robert Burns himself gauged after this fashion. A rude attempt to allow for the ever-varying thickness of the heads of casks is made by causing the wooden calipers by which the officers take the lengths to show two inches less than the actual outside measurement. This arbitrary deduction of an inch from each head has to be revised by the guesswork of the gauger, who deems it sometimes necessary to greatly increase this allowance, and at other times actually to add to the length shown.

To obviate this chance-work, Mr Geo. D. Ham, a surveyor of the port of London, who has compiled several standard works on the customs and excise regulations for the revenue and mercantile communities, has just patented an ingenious invention for measuring the *internal* lengths of casks with absolute certainty by a rod or staff, which, when placed in the bung-hole of a cask, not only takes with absolute accuracy the exact internal length, and indicates it on the upper part, but actually registers it; so that at any time after he has withdrawn the rod, the gauging officer can, on referring to the instrument, see what is the length of the cask. The name given by the inventor to this instrument is Endometer (interior measurer); and this in conjunction with another invention of Mr Ham's—his Micrometer Compasses, which indicate the thickness of the long staves—will enable the heavy customs duties on foreign spirits to be assessed with an accuracy never before obtainable. The same ingenious officer has, after many years of patient experiment, improved the rule for making revenue calculations in regard to the ullage quantities—that is to say, the actual liquid quantity in casks not full. The quantity that a cask will hold when full—technically called the 'content'—is the basis for all subsequent calculation. As the casks remain in the warehouse they of course gradually become less and less full, and the quantity in a cask not full has hitherto been arrived at by a long and circuitous mode of double casting, supplemented by mental calculation. But Mr Ham's rule shows by one setting the exact ullage in the cask; and more than this, the same rule computes by one single setting the 'proof quantities'—that is, the standard or proof strength at which duties are charged and the revenue accounts kept.

As perhaps some of our readers may not understand what is meant by 'proof' quantities, we may observe that a certain mixture of alcohol constitutes what is termed 'proof,' and when the 'spirit'—brandy, gin, rum, &c., as the case may

be—does not contain this proportion of alcohol, it is termed 'under proof,' and an exactly corresponding deduction is made from the duty charged. On the other hand, if it contains more than the standard of strength, it is called 'over proof,' and charged accordingly. Thus, 100 liquid gallons at ten 'U.P.' are reckoned as 90 gallons; and on the other hand, some of the concentrated German spirit, now so extensively imported and, among other purposes, used largely for the adulteration of brandy, gin, rum, &c., is sixty-nine 'O.P.'—that is to say, 100 liquid gallons reckon and are charged as 169 proof gallons.

It is confidently expected that Mr Ham's inventions will revolutionise gauging. Whilst they are calculated to effect much saving in the time and labour of officers of customs and excise throughout the United Kingdom, their principal claim to consideration is that they will secure exactness in the assessment of revenue duties.

AUTUMN BLOOM.

Young Spring had gone by blushing, and kind Summer
Had smiled and lingered, then gone out of sight;
When Autumn came, a wrinkled sad new-comer,
With dark eyes dimmed in Memory's misty light.

I sought the woods—the hawthorn leaves were sear;
The haws were plucked, or withering on the bough;
The blue-bell stems had fallen prone—How dear
Their beauty and their fragrance would be now!

Then o'er my soul swept great waves of self-pity:
'Why has my time for joyance come so late?
My summer stilled in the smoky city—
And now the flowers are dead! O cruel Fate!'

I sought my chamber. Rain came hurrying down—
Resistless rain, that hid the solemn hills,
And quenched the laughter of the little town.
Then grew I more content with all my ills,

As with faint water-colours day by day
A landscape blurred was sketched by the wild rain—
'The year and I have both grown old and gray;
No bud shall blush or bloom for us again!'

After a week, I lifted up my eyes;
The sun was shining, and I ventured forth
Down by the river. What was my surprise
To see a rosy blush there in the North

On Tinto's cheek! Old Tinto, that had stood
Black-browed and frowning all the summer o'er.
'Twas heather-bloom! Then thought I: 'God is good;
Even in Autumn there are joys in store.

'O heart, hard heart! put on thy Autumn glow
(A richer red after the rainy weather!);
Mourn not for Spring, for the lost Long-ago;
But clothe thy yawning clefts with honeyed heather.'

TAWNY AUTUMN.

ONE afternoon in late autumn I ascended a gentle hill for the purpose of seeing if Nature had lit her beacons of bracken to warn all whom it might concern that the warfare of the seasons was about to commence.

Yes; there they shone, those flaming warnings, lighting up the dim green fastnesses of the distant fir woodlands with a glowing fire, so intense that the sky above them seemed to reflect the glory. But on closer examination I concluded that it was not the reflection of the bracken which thus mellowed the sky, but the softened radiance of the autumn sunshine which was not strong enough to absorb the moist and veiling atmosphere saturated with the laboured breathings, if I may so put it, of the dying foliage of the surrounding forests.

This throbbing haze, this tawny tint, gave a distinct character to the day. It stole out of the captive sunshine and rested upon the stubble-fields, and it was repeated with staccato effect by the yellow flowers which predominate in autumn. The yellow orbs of the silver-rayed daisy led the harmony of colour, for the tiny flower is Nature's hardiest pioneer and claims a share in every grassy sod all the year round; the blond enamel of a few lingering buttercups contrasted with the crumbling gipsy gold of the tall dock-sorrel still flourishing luxuriantly; the garish ragwort fringed the stubble, its gilded blossoms and rank spreading stems as strong as when in days of yore it was the dreaded steed of the witches who scoured the midnight skies; the sensitive mouse-ear hawkweed unfolded its golden fringes after the noonday siesta; and the straggling spires of the yellow bedstraw shone in the sun: all these accentuated the autumnal effect.

Still more pronounced was the russet bronze of a distant belt of beeches, lifting their sleek gray trunks beside the waters of a pool faintly shining at the base of the hill beyond the stubble-fields, its neutral tint broken by the silver track

of a water-hen, like a crack upon the smooth mirror.

The leaves of the elms crowning the hill came pattering down sapless and insect-eaten, and the remaining once green and rustling foliage had a duskier look in its scantier abundance, though a grateful circumference of shade still fell upon the warm sward, grown springy and soft through the constant nibbling of innumerable sheep.

The grasshoppers were enjoying the dewless afternoon, springing their whirring rattles to proclaim their presence in a hundred directions upon the sunny slope; and so still was the air that the curious 'flop' caused by their grotesque leaping as they filliped over the grass was distinctly heard.

This surrounding stillness, this spacious silence, is a never-failing satisfaction to me; it proclaims the fact that patient sunburnt Nature does all her unending works in that unhasting leisure which is almost immortal. Her stillness is the benign repose of conscious power—not the dull inertia of sheer exhaustion—not the vacant forgetful sleep of death.

'There is no death; what seems so is transition,' cries Nature, echoing the poet; and she proceeds to prove it by sending the last tenacious leaves of autumn from the boughs, pushed thence by the strong young buds of next year's spring. They are there on the trees, curled up and hiding amid the autumn tints; they will brave the winter, wrapped securely in downy sealed sheaths, awaiting her beckoning signal to burst forth in a silent haste.

She sends clouds of aerial seeds on their wandering mission of propagation, and she snugly hides beneath the earth millions of dormant living forces to bide the time when she shall command them to renew the yearly miracle of the spring. 'There is no death; what seems so is transition;' for Nature's old familiar forms, her primal elements, are continually being moulded anew into fresh creations.

While I was thus musing, fanned by the odorous south wind, and more than half asleep in the

languid afternoon, my ears were sharply assailed by what seemed to be the rapid cannonade of a mimic warfare. 'Pop! pop! pop!' came the prompt and steady discharge. Was Nature bewitched, or had I chanced upon a veritable 'Sleepy Hollow,' and thus become 'fey?' I started up fully awake and listened again. Again the mimic warfare raged at intervals, but where were the cannon-balls that were evidently flying about?—A marvel, a marvel! A ball suddenly struck my hand, and lo! it was a pea from a clump of broom bushes beneath whose shade I lay. The bushes had long lost their golden blossoms, and they now stood darkly green, laden with ripe pea-pods which now and again burst with a loud noise under the influence of the light and heat.

But anon another sound came echoing over the hill, and the woodlands became vocal with the hallooing of huntsmen, the baying of hounds, and the musical call of the horn. The red-coated riders came hurrying over the hill, leaping the fence near which I stood; swiftly they rode along the russet leaf-strewn path, hastening away to the upland woods in which sly Reynard was hiding.

It needed but this vanishing touch of scarlet to reveal the full warm splendour of the tawny autumn day. How the brown and crimson of beech and oak burst upon my vision as it followed the hunters flashing through the wood! How golden were the swinging tresses of the lady-birches against the far blue sky! how brilliant shone the poplars by the pool! A pheasant rose on heavy tawny wing; a brown rabbit hastened to its burrow in the bank of red earth just visible between the gaps of flaming bracken; and the mellow haze melted imperceptibly and harmoniously over all, as it leaned from the sky, softly pillowed upon the fragrant southern breeze.

Straight and level flashed the sunshine into many an otherwise unperceived brown burrow, revealing here and there a startled pair of twitching ears and a timid twinkle of fear-distended eyes as the sound of the horn and the 'Hark, away!' were borne backward through the woods. Slowly, slowly the drowsy calm returned to the warm hillside where tawny bees—those swart sun-lovers—were roaming, forgetful of the dew of the morning as they swung from flower to flower.

I descended the hill—for the pool shining far below attracted me—giving a wide berth to the straggling bramble sprays that would fain have detained me; passed a group of mountain-ash trees gay with coralline rowans; and paused to note the mossy crimson excrescences studding the leafy stems of the wild-rose bushes, for these gay imitators of the long-departed roses were the lovely many-celled homes of minute white worms.

At length I stood on the verge of the pool, just in time to see the last of the meadow-sweet shower its florets of foam upon the still water. The reeds were growing rusty and beginning to sigh in the rising autumnal breeze; soon their sapless pipes will flute the music of Pan the river-god—that wondrous music which awaits the passing-by of the poet to interpret its wind-swept melody.

I stood so still among the rushes that an unobtrusive thrush alighted on a gray stone almost at my feet. He had a snail in his bill, and he flung

the shell against the stone with a force that shattered the protecting home of the succulent inmate. The dainty was greedily swallowed by the thrush, who stood quite unconscious of my proximity, with his speckled head erect and eager.

How the wind sung in the firs that autumn day! It was a song that will live in my memory for ever. Now it sounded faint and far, crooning the dirge of the dying year, and ever it rose to higher heights of melody until it seemed to shake the woodlands, striking upon the harps of the firs with terrible chords as powerful as the sound of many waters.

Leaves were whirling, acorns and beech-mast were dropping into the ruffled pool, and no song of birds broke with familiar and reassuring treble upon that wondrous, primeval music from which I at last turned, awe-struck, away.

MR ESHOLT'S YOUNG WIFE.

A STORY IN TWELVE CHAPTERS.

CHAPTER II.

THE Rev. Edward Granby was vicar of St Mary's, Ecclesfield, a small country town on the north-east border of Lancashire. The living was a comfortable one, and as his wife had brought him a small fortune, he was tolerably well to do in worldly matters. He had not married till rather late in life, and had had but one child, the young lady whose acquaintance we have already made, who at this time was nineteen years old. His wife had died many years before the opening of our story, and from that time the little household had been governed by his unmarried sister, who was some fifteen years younger than her brother.

Mr Granby had neither an impulsive disposition nor a warm temperament. Beyond his family circle he had never contracted but two real friendships, both of which dated from his college days. Of those friends one had been Wilmot Burrell's father; and the other a person whose life had been given over to commercial pursuits in a distant town. He, however, had died some half-dozen years back. When Wilmot's father lay on his deathbed, Mr Granby promised him that he would bring up his son as though he were a child of his own. That promise he had conscientiously fulfilled. When the boy was old enough, he had been sent to a good boarding-school, but all his vacations were spent at the vicarage. When, at sixteen years of age, he was asked what business or profession he would like to follow for a livelihood, he replied that he wanted to go to sea, and to that determination he adhered in spite of all persuasion to the contrary. As Wilmot had no fortune of his own, Mr Granby did not feel justified in obtaining a commission for him in the navy (it was before the days of competitive examinations); he was consequently obliged to fall back on the mercantile marine. A little while later a situation was found for the youngster as trading captain's clerk on board a merchantman belonging to a large firm in the African trade. He had been several voyages already in that capacity, and so well were his employers satisfied with him, that on this occasion he was going out in the responsible position

of supercargo, with a small commission on the freight in addition to his salary.

Agnes and he had been so much together almost from childhood that it seemed but the natural outcome of their intimacy that they should become engaged to each other when they grew up. Mr Granby offered no opposition to the arrangement, for although Wilmot was without private means, he had so imbued the simple-minded vicar with a belief in his abilities that the latter felt sure he could not fail to make his way in the world; besides which—and this latter reason was a weighty one with the vicar—Wilmot was the son of his dearest friend—the friend of his youth—to whose memory his thoughts still clung with old-time tenderness. Then, again, Agnes herself would not be without fortune—a much larger fortune, it might be, as the vicar often said to himself with an inward chuckle, than anybody was aware of. Little was said about it at the vicarage, but it was looked upon as a settled thing that the two young people should become man and wife at no very distant date. It was a matter about which there was no need for hurry.

With our little group at the vicarage time flowed on for some months after Wilmot's departure freighted with little or no change. Day followed day, and one week merged itself into another, each bringing its round of humble duties and its share of quiet pleasures; but neither in their thoughts nor their conversation was the young wanderer forgotten.

It was about Christmas when Miss Maria first began to notice how much her brother's correspondence seemed to have increased of late, and how he would stand gazing out of his study window of a morning watching impatiently for the coming of the postman. For several years past his friend Squire Dorison had sent him the *Times* day by day after it had been duly read and digested at The Sycamores, and this had hitherto satisfied all the vicar's requirements with regard to news from the outside world. But now the local bookseller had orders to obtain the *Times* direct each day and forward it to the vicarage immediately on its arrival, which, in those days, when the railway system was far from being as complete as it is now, was not till about six o'clock in the evening. The vicar's absences from home, too, began to be more frequent than they had ever been before. He had business of importance to transact, he told his sister, at the market town a dozen miles away. Miss Granby felt that there was a secret somewhere, the first there had ever been between her brother and herself, and she strove in her quiet way to fathom it, but in vain.

As the winter advanced she was pained to see how much older Mr Granby began all at once to look. His parishioners, in their homely way, said among themselves that 'the parson was getting the worse for wear.' The lines round his mouth and the furrows on his brow grew deeper and more plainly observable, and he acquired a habit of touching the wall with his fingers as he walked about the house, as though he were not certain of his steps. Miss Maria felt sure that he was ill, and told him so, but he replied that it was all nonsense, and peremptorily forbade her calling in any medical advice. As winter

merged into spring his correspondence grew more weighty and his absences from home more frequent. His congregation complained that his sermons became weaker and more diluted every Sunday, and that he frequently said the same thing two or three times over. As spring advanced he grew weaker in body and more preoccupied in mind, and a strange feverish excitement shone in his eyes, once so calm and gentle. His temper, which had wont to be so sweet and equable, had now become irritable and uncertain. Still, seeing it could hardly be said that he showed signs of any absolute bodily ailment, it came as a great shock to all who knew him when one morning it was reported through the town that the vicar had been found dead in his bed. All his failings of late were forgotten in the recollection of his pure and blameless life and of his faithful labours in his parish for nearly forty years.

But still greater was the shock when it became bruited about that he had died a pauper, one victim among thousands of others—for that was 'King Hudson's year'—to the mania for speculation in railway scrip and shares. The accumulated savings of many careful years, together with what was left of his wife's fortune, all of which had been intended for his daughter, had been dissipated in a few fatal months. The small ventures in which he had at first embarked having proved successful, he had been lured into deeper waters, only to struggle desperately for a time, while sinking deeper and deeper, and be hopelessly submerged at last. The key was found, the riddle solved; and when Miss Maria went in memory over her brother's manner and conduct during the last six months, she partly realised through what a soul-crushing struggle he must have passed. Too thoughtful for those he loved to make them sharers of his sufferings, perhaps too ashamed to let them become aware that he was a gambler and a dupe, he had locked up the secret in his breast, and unable to retrieve his steps, had gone on from bad to worse, hoping against hope, till the fatal knowledge, no longer to be gainsaid, that he and those he loved dearer than life were irremediably ruined, had crushed his already enfeebled constitution with its intolerable weight, and in the effort to bear up under it his heart had given way.

A number of bills which Miss Maria had believed to have been paid long before came trooping in like clamorous wolves as soon as the news of Mr Granby's death was circulated abroad. None of them was heavy individually, yet when taken in the aggregate they made up a total sufficiently alarming to one who saw no means of liquidating them. Miss Maria, after painful reflection, saw no course left but to sell off the library and household furniture, and after everybody should have been paid, for her and Agnes to retire to some spot where their story would be unknown, and there face the dark future as best they might.

So about a month after the funeral, the sale of 'the late Mr Granby's valuable effects' was announced in the usual way. This after-pain was very bitter both to the elder lady and the younger one. To have the home of so many years broken up, rendered still more sacred, as it seemed to them, by the recent presence of death—to have the hearth round which so many

memories clustered invaded by careless strangers, no chamber too sacred to restrain their callous curiosity and thoughtless remarks, no article to rest unprofaned by their rude touch, accustomed to appraise everything by the scale of the auctioneer's hammer—to hear her brother's conduct commented on beneath his own roof by those who saw only one side of the picture—was more than Miss Maria could bear. She had sent Agnes away to a friend's house, wishing to spare her all unnecessary pain, intending herself, true to her theory of duty, to remain on the premises till the last. But at the end of the first day after the contents of the vicarage had been on view, she was compelled in sheer weariness of heart to abandon her post, and leave the house and all it contained in charge of the men appointed by the auctioneer. There were some few things she could not bear to see pass into indifferent hands, which knew not the holy value they possessed in the eyes of a daughter and a sister. Such were the large Bible out of which Mr Granby had been used to read to his household daily for many years; the family clock, an antique piece of furniture, which had stood in the old house at home when Miss Maria and her brother were children; the bed on which the vicar had died, together with an easy-chair and a few other articles. These dear relics Miss Maria caused to be removed prior to the sale.

When all was over and all debts had been paid, Miss Granby found herself with a balance in hand of twenty-five pounds. This sum, together with an annuity of her own of twenty pounds a year, was all that she and Agnes had now to depend upon. Whither should they go? To what spot should they retire? It was evident they would have to labour for their living, and in some large and busy centre of life their chances of obtaining suitable employment would be much greater than in a small provincial town. To some large town, therefore, they must go. Not to London—it was too far away, and the very mention of it frightened Miss Maria, who had never been there, but who had heard fearful accounts of its size and wickedness. Not to Manchester—nobody but factory people lived there, or so ran the belief in remote country places; and besides, it was said to be exceedingly smoky and dirty. Why not to Liverpool? What place could be more eligible than that flourishing town? 'Indeed, I may call it a delightful town,' said the spinster, when debating the point with her niece. 'I spent a month there when I was about your age, and I remember that it was a continual whirl of dances, concerts, and picnics across the water. But I daresay the Liverpool people have sobered down in some measure by this time. And very genteel society, too, my dear, which is always a comfort to any one who has been properly brought up.' So to Liverpool it was decided that they should go.

Agnes was secretly delighted that they were going there, for she would then be on the spot to welcome her lover on his return. She had written to him, informing him of her father's death and their altered circumstances; but there had not yet been time to hear from him in reply.

A fortnight later, our two ladies were settled in their new home.

It had been dreary work hunting for lodgings, and it was not till the afternoon of the fourth day after their arrival that Miss Granby and

Agnes succeeded in finding rooms which were at all to their liking, and fulfilled some at least of the requirements which Miss Maria had catalogued in her own mind as being absolutely essential before setting out on their weary search.

'Liverpool is very much changed, my dear,' she said to her niece with a melancholy shake of the head—'changed for the worse, I'm afraid, since I was a girl. It is so dismal and dingy, that I should scarcely have known it for the same place, and the manners of the people seem to have very much deteriorated.'

The apartments they had engaged comprised what is called the 'parlour floor,' together with a small extra room fitted up as a kitchen, of a small house in a quiet street off the London Road.

Next day, when places had been found for the few articles of furniture they had brought with them from the vicarage, *vice* sundry other articles dispossessed, the rooms put on a much more pleasant and home-like appearance. And yet what a contrast to the dear home they had so lately left! To dwell upon the difference would have been heart-breaking, and neither of them spoke of it to the other. Neither of them forgot the white-haired old man lying low beneath the shadow of the yews in a far-away churchyard. He was much in their thoughts. With the familiar voice of the old clock sounding in their ears, they had only to shut their eyes to enable them to fancy themselves back at the vicarage, and to half expect to hear the vicar's well-remembered footstep in the passage. They cried quietly together without speaking much, like women who know and comprehend each other's sorrow.

No sooner were the breakfast things cleared away next morning than our two ladies set themselves seriously to consider what kind of regular employment it behoved them to look out for—'something at once genteel and remunerative,' as Miss Maria put it, 'and suitable for ladies in reduced circumstances.' Truly, a difficult question to decide upon—a question which, so long as they were at a distance from the spot, had not been without its hopeful aspects and had seemed capable of easy solution, but which, now that they were here among the veritable bricks and mortar of a large town, put on quite a different appearance. The longer they discussed it the more nonplussed they became. At last, in sheer despair, they summoned Mrs Strake, the landlady, to their councils—a worthy person, not devoid of ideas, only that her wits moved slowly, as though they needed lubricating. She did little more than shake her head and say, 'she really didn't know' and 'she really couldn't think.' Miss Maria was a little disheartened, but would have scorned to acknowledge it.

Next morning, after carefully scanning the advertisements in the newspapers, among which they found nothing likely, they put on their outdoor things and sallied forth. Arm in arm they went for a long ramble through the busy streets, peering into the shop windows and those of establishments and emporiums of various kinds, but nowhere finding an announcement of anything likely to suit them, as, indeed, it would have been somewhat wonderful if they had. At length, to Agnes's great delight, they found themselves on

one of the quays near the Prince's Dock, with the splendid river shining full and broad before them. They stood for a long time watching the steamers flitting to and fro, and the great ships floating out with the tide, and the busy crowds of people that swept round them in an unending stream. And so the second day came to an ineffectual end.

Mrs Strake came up from her basement kitchen next morning with the breakfast tray, and a suggestion that the two ladies should open a school in their little sitting-room for young children. There was nothing of the kind in the neighbourhood, she went on to say, and the want of one was much felt. She herself would engage to find seven or eight scholars among her neighbours to begin with; and by putting a card in the window, they would no doubt before long have as many as they could find room for. Then she added that if the ladies agreed to her proposition, she should want an extra shilling a week added to the rent, in consideration of the annoyance and dirt which a number of children 'traipsing' in and out of the house would cause her.

Miss Granby, after thanking her, said that she would take a little time to consider the matter; but at the end of a couple of hours she sent for Mrs Strake and told her that she and her niece had decided to accept the suggestion. So in the course of the day Miss Maria hunted out a few second-hand benches at a broker's shop, and purchased some spelling-books and other needful stock in trade, and on the Monday morning following the school was opened in due form. In a fortnight from the date of opening they had as many scholars as they could accommodate. It was a pretty sight to see the youngsters come trooping in of a morning as the clock struck nine, each bobbing a little courtesy, or touching a shining lock brushed carefully by loving hands before leaving home. Miss Maria they liked, though they stood considerably in awe of her; but Miss Agnes they loved with all their hearts, as who, indeed, could have helped doing.

The children were young and their parents poor, and Miss Maria's charges were necessarily low, so she soon discovered that, notwithstanding the number of her scholars, it was imperatively needful that she and Agnes should seek some additional mode of adding to their income. Consequently, Mrs Strake was again consulted. That slow-thinking person revolved the matter in her mind while washing up her pots and pans, then she went up-stairs and standing before Miss Maria, said abruptly: 'Shirt-making.' A blush mantled on Miss Maria's cheek as the word fell on her ears; and after that, she fumed for a couple of days at the thought of two gentlewomen lowering themselves to do work of the character implied. But as the great fact that they could not make ends meet out of their present means forced itself more forcibly on her mind, she began to see the necessity of yielding, at all events for a time, and till something more eligible should offer itself. So Mrs Strake's services were put in requisition, and by means of some occult influence possessed by her, our two ladies were supplied by one of the large outfitting firms in Lord Street with a number of shirts, ready cut out, which they were required to hem, fell, backstitch, gusset, and turn out complete at all points, and that for a sum so

preposterously small that Miss Maria went red and white by turns with surprise and indignation when it was told her, as many unfortunate seamstresses besides herself have done both before and since. The additional income from this source would have been hardly perceptible had not both aunt and niece sewed away hard and fast, early in the morning and late at night long after school hours were over, till cramped fingers and aching heads compelled them to leave off till the morrow.

MEDICAL PRACTICE IN THE WEST OF ENGLAND.

It used to be said that the march of civilisation was always going westward. Probably it is, and that is the reason why so many habits and theories remain in the western counties, civilisation not having yet driven them out. I suspect that when another generation has had time to show the benefits of compulsory education, there will not be in this western county such interesting patients as I have met with in my practice of twenty-three years. It is not to be understood that every one of the incidents actually occurred to me, but they either came within my personal knowledge or were told me by people upon whose statements I could rely.

Now and then the belief in witchcraft appears either in conversation or in the police reports. A girl about twenty years of age had long suffered from headaches, which were largely due to working in a noisy factory. Now, please to follow the old mother's train of reasoning: the headaches resist the action of medicine—in which the west-country folk have the strongest faith—and there is no apparent earthly cause. The factory sounds are altogether left out of court. Therefore, it is presumable that the girl is under some supernatural influence, or, in the old woman's language, that she has been 'overlooked,' or that 'some one have 'a put some'at upon her.' Now for the cure. Jane Tomkins is going to the 'wise woman' at Wilston for professional advice, and takes the patient with her in the donkey cart—a Sunday expedition of ten miles out and ten miles home. But, alas! this was of no use; the fee was a sovereign, and the girl was all but destitute. The reader will be glad to learn that the headaches yielded to the quiet and good food of a household where Maria has long been a domestic servant. By the way, the errand which led Jane Tomkins to take her long drive to the 'wise woman' was rather interesting. Her husband had lost his wages on his way home after being paid; and Jane hired the donkey and cart to seek the help of the Wilston witch. Now, this spiritual person required carnal reward; for revealing the place where Jane's twelve shillings had been lost, this mercenary prophet asked fifteen shillings!

But this credulity is not found only among the uneducated. I think that a shoe of a horse or donkey would be found in the dairy of most farmhouses which have been standing for fifty years. A necklace made of short lengths of woody-nightshade is often put on a child who has had fits, to keep off evil influences. Witches and evil spirits are unwilling to pass over running water; this fact has been turned to account in this way: mercury by its fluidity is

supposed to cheat a short-sighted spirit, so it is worn in a little bottle hung round the neck night and day. I have seen this myself.

Fifty or sixty years ago, the rector of a village near the town where the writer lives was famous as a witch-finder. I have never learnt what he did with his victims. I say victims, because I suspect that cruelty and injustice were done to many poor old women without any reason whatever except the malignity of their neighbours.

While some of my patients are credulous, they are also very fond of assigning causes to all their diseases. Happily, they are easily satisfied. For instance, an innkeeper had a feeble child who did not take much food. The father was much disturbed about this, and confided to the doctor his belief that the son 'hadn't got no glutcher to glutch anything.' ('Glutch' is Somerset for 'swallow.') In infancy, the cause of all maladies is the 'wind;' later, 'teeth;' then comes the period of 'worms.' Later in life, everything arises from a 'chill' or a 'strain.' Both of these last are causes acting from the outside, be it noticed; a subtle compliment to the soundness of west-country constitutions. We do not like to confess any weakness in ourselves: all illness must come from a chill (that is, the climate) or a strain (that is, violence).

Townpeople are often troubled with sleeplessness. Perhaps we do better in this way because we live with green grass before our eyes. Professor Bain says that this is very soothing. Fresh air and early hours are also soothing, so that we in the west are apt to be sleepy. I once saw a farmer sitting out in his field on a three-legged milking-stool, with the pail between his knees, sound asleep. The cow had walked off, leaving him there with rain pouring into his pail instead of milk.

But another patient was constantly subject to fits of drowsiness. He was a professional man, and was much troubled by this tendency. One afternoon two parties—two or three persons in each—came to his house by appointment, and were sent into separate rooms. While talking to the first set, he had occasion to go to another part of the house to fetch a paper from his private room, passing through the room in which the second set were waiting. He sat down at his writing-table to take out the paper, and fell asleep. No one went to look for him; and when he awoke, about three-quarters of an hour later, all the people had left his house, tired of waiting.

This gentleman gave me a curious instance of the survival of the old doctrine of 'sympathy.' Price, a farmer who rented some of his land, had borrowed some hayforks from my friend, who had also fields which he farmed himself. Some careless person had placed a hayfork—prong upwards—against a haystack which was being made. The farmer's son coming off the stack, slid down, instead of descending by the ladder in the usual way. He unfortunately struck his leg against one of the points of the fork, producing a nasty wound, which went on badly, and eventually caused him to keep his bed. The landlord called at Price's house one morning to ask for the return of his hayforks, and hearing of young Price's accident, offered to call upon his medical man and ask him to go and see the injured man. 'No, sir,' said the mother; 'I won't trouble you; I think we can

manage without the doctor.' And then she went on to say that all the hayforks should be returned at once except one, this being the one which had caused the accident. It had been wrapped up with certain herbs and buried in the garden, that the wound might be healed through the influence of the herbs on the weapon which caused the wound. I have never met with any other instance of belief in the doctrine of sympathy propounded by Sir Kenelm Digby about 1650. Many of our readers will remember the story which Digby tells about a man who had been wounded in a duel, and who had obtained the loan of the sword from his enemy. The weapon was covered with 'sympathetic powder' and carefully laid aside. Then the wound became less painful; but a servant finding the sword, began to clean it, and the wounded man at once felt feverish, and the sore place grew hot and irritable. The patient suspected the cause of his pain, and ordered the powder to be again laid on the sword, which was carefully locked up until the wound had healed.

It was a common thing in one district, twenty years ago, to see a pitchfork in a bedroom. This peculiar weapon was so popular because a robber had been wounded by one; and the two punctures, of unmistakable shape, had led to the conviction of the criminal.

Very strange messages are sometimes sent. A favourite formula is, 'I don't expect she'll be alive again I get back.' Notes are often very curious. This is a copy of the best I ever received: 'GREEN-VALE, *Ogest* 11, 1879. Mr Toumkus. Sir if you Ples to send me one botol more the Lorshen Woter [lotion water]. Doses my Leg Gretel [a great deal] Good 2 Boxes Ointment with Burge [the carrier] then make out my A Count I am going to Live Greenvale by the midel the month of September.—From your Obedient Sirvent JOHN SMITH.

'Btes [Please] to Exquise my Writing and Spilling.'

Part of the difficulty which the untaught find in writing letters arises from the trouble they have in expressing their ideas, sometimes inclining to be over-particular about their words; for instance, the verb 'create' is always used when medicine is desired to bring an appetite. One of the most miserable old women I ever saw, when asked whether she could eat her food, said: 'I thank—I praise my glorifol Heavenly Father—I have a middlingish stomick to my vittles.' And a woman, to show how eager for his meals her husband was, said: 'He do bäal [bawl] for his vittles loud enough to zlat [crack] his kecker' [windpipe]. This difficulty in giving shape to their ideas makes some patients very trying to a busy medical man. If asked, 'What do you complain of?' they seem to think it a sharp repartee to reply: 'That is what I came to be told, sir.' The answer from an impatient doctor used to be: 'Then just sit down for half an hour and think what you came here to tell me.'

A man came into the surgery one day with a lot of mud on his clothes. He was asked, 'What have you been doing, John?'—'O sir, 'twas all along o' that there powny; he clipped up and he fell down, and he drawed [threwed] I down, and he drawed hisself down, and there we was booäth down together.' This wonderful sentence, which is quite genuine, is equivalent to the fact that the pony had fallen and thrown the man.

These expressions are queer; but the ideas of nurses are queerer. Why should a newly born infant be smeared all over with lard? Or why should the poor little thing have its head anointed with brandy? I can account for this last practice on the part of many nurses, as I have seen the way in which they warm the spirit. The temperature of her mouth being about the same as that of the infant's head, the nurse takes a mouthful of brandy, and after allowing it time to grow thoroughly warm, she ejects some or all of the diluted spirit into her hand and pours it over the little round head. Brandy must be very attractive to the poor, if one may judge from its universal use in emergencies. There is always consolation for the sorrowing relatives to be derived from it, even if the patient has gone beyond the need of stimulants.

I knew an old farmer who was a doctor himself in a small way; for instance, he had his finger crushed; and it was so treated (not by me) that the bone projected from the stump. This he took away by rubbing it down on the farmyard grindstone! The medical man who piloted him through his childhood's diseases must have practised about the beginning of the century, but he anticipated one point of modern practice, namely, dressing with fresh garden soil, as follows from the old man's account of his treatment of an attack of fever: 'Dr John Franks, he wur a practical man, he wur. What d'ye think he did wi I when I had the veaver? [fever]. He told my mother she wur to have a hole dug in the gæarden, and take I out of bed and put I neaked into thic there hole, cover I up, and there let I bide for zoo [so] long. Well, I got better, you know.' And this being *post hoc* (treatment), was, of course, *propter hoc*.

These notes have been mainly about patients. There is not much that is peculiar about country-doctors in the present day; they are very much like the rest of the faculty. But thirty years ago, many of them wore a white necktie and black clothes, such as are now considered suitable for evening dress. This did not apply to the riding doctor, who went about on horseback in buckskin breeches and topboots. One gentleman of this kind left in his wardrobe at his death twenty-four pair of these enduring garments, and he was the consultant of the neighbourhood, or, as his nickname went, the 'one-pound-one man.' Great was the consternation in a farmer's family when, at the end of an attendance through a long illness, this buckskin physician sent in a bill for three hundred guineas. A similar emotion was felt by another farmer in the following circumstances. His wife had a tumour which needed removal; his own medical man was quite competent to do the operation, but the farmer wished a 'London doctor' to officiate at the patient's home, about a hundred and twenty miles from town. When all was done and the London surgeon about to leave, the husband said: 'Please, sir, what be I in your debt?'—'Oh, let me see. Eighty guineas is the proper fee.' The farmer very ruefully went and found eighty pounds, and said: 'I suppose that will do, sir?' (His own medical man would have received five or six pounds.) Mileage may be a very convenient basis for demanding a large fee, but surely it is a most fallacious and unjust mode of estimating the value of a medical man's services. The guinea per

mile of the old consultants probably arose from the cost of posting, which would be the only available means of reaching a patient in an emergency, or of getting into out-of-the-way places at any time. But all this has been altered by the railway system, and consultants' fees have been lowered.

In the old times, the medical man was the friend of the family to such an extreme degree that when a new member was added, the doctor was expected to spend many hours with the rejoicing father and his friends. Pipes, beer, and a bowl of punch helped to swell the general cheerfulness.

A lady told me that the medical man who was in attendance at the time of her birth received from her father three guineas, half a loin of veal, and a hogshead of cider. I was once offered a pair of old silver sugar-tongs by way of a fee.

The poor have a naked directness about their remarks which would astonish sensitive people. A foolish nurse once bent over the bed of a very nervous woman and said to me in an awe-struck voice: 'Do you think she will recover, sir?'—Going up some very narrow stairs to see a young man who was seriously ill, his mother remarked to me: 'These stairs are very awkward, sir—very bad for getting a corpse down.' It may comfort the reader to know that the patient was much too dull of perception to be hurt by the unpleasant suggestion.

Cautions are given in works on nursing against talking in whispers before the patient or in an undertone just outside his door. But imagine the training and tact of a London (not west-country) nurse who said to the gentleman in her charge: 'When the change has come, would you like your face washed every morning, sir? Some gentlemen do—they say it is so refreshing.' In anticipation, I suppose. But it was a delicate attention to the lifeless form.

A little boy's leg had been broken by a kick from a cow. While I was setting the fracture, the father, standing at the bottom of the bed, remarked sympathetically: 'He allays wur a caddling [clumsy] little toöad.'

But this is not the rule. Sympathy with suffering, kindness to their fellows in distress, and generosity out of all proportion to their means, are often met with among the simple west-country folk. With an instance of this I will close these notes: a labourer's wife, with children of her own, bending over and caring for her neighbour when in 'nature's hour of trouble,' and at the same time suffering from diphtheria!

WHO DID IT?

A STORY IN FOUR CHAPTERS.

CHAPTER III.

WITH the first gleam of daylight, Dick Ottery slipped out of the house and went down to the scene of the suspected murder, to search for some clue which might lead to the detection of the crime. He found the watch, as he had expected. It was lying on the floor at some distance, shattered. It had stopped at a quarter past two, and Dick gave a sigh of relief, for he knew, as would everybody else, that at that moment he was engaged in the cricket-field, and that, therefore, whatever

suspicion might be coupled with his name would be cleared, unless it should be shown, upon examination of the watch, that its works were unbroken and that it had stopped in the usual course.

The book which the poor old gentleman had been reading, an ancient copy of Camden's *Britannia*, was still open on the table, and his spectacles lay upon it, as if he had paused in his reading to meditate. On the floor lay his hat and his stick. Dick knew the stick well—a plain cane with no knob or hook with which a deed of blood could have been committed. He examined the room, peered into the rat-holes in the flooring, scrutinised the soil outside for footmarks; but there was nothing whatever to betray the murderer. Then he examined the bushes around for traces of a hasty flight, looked for marks on the wall, all without result, so he returned to the house with the articles he had found.

The news had of course very soon spread abroad that old Jethro Seaton of Colyton Hall had been found dead in his summer-house, and that foul-play was hinted at; and, as Dick had anticipated, people at once whispered to each other, as they talked of the affair over garden gates, at cottage doors, or in groups at the roadside, that young Mr Ottery had in one of his quarrels struck his uncle over the head and killed him.

The inquest was held at the Hall. The evidence of Dr Waller was decisive—that death was not due to natural causes, such as a fit or apoplexy, but that the old gentleman had been struck violently behind the ear by some blunt instrument, certainly not by the stick produced, and not by the chair, which had fallen also. And so, in the absence of all other evidence, the jury returned a verdict of 'Wilful murder against some person or persons unknown;' the hinted suspicion of a jurymen who had once received a thrashing from Dick for cruelty to a horse, that the nephew might know something about the death of his uncle, being at once quashed by the evidence of a watchmaker who said that the mainspring of the watch found in the summer-house was broken, so that the hour indicated was exactly that at which the crime had been committed.

On the next day, the remains of old Jethro Seaton were buried in the family vault; and, small claim as he had upon the affection of the people, he was followed to his last home by all the village, far more, it was understood, out of respect and affection for Dick and Mary Ottery than for him.

It was strange that, amidst all the conjecture and sifting of evidence, no one had thought of associating Claude Shute with the crime—that is, nobody but Mary Ottery. So soon as Dick's innocence was established in her mind, the terrible suspicion had arisen within her, and had refused to be dismissed by argument or sentiment, that the man who was really dearer to her than all else in the world could alone have committed the murder. Everything pointed to the probability. He was at the Hall twenty minutes before the time indicated by the shattered watch as being that at which the deed was done. He had gone to London by the three o'clock train, and, so far as Mary could remember, he had only gone to London once or twice before during the two years of his courtship. Most convincing evi-

dence of all was the tone of the very last conversation she had held with him, the result of which had been that he had unwillingly accepted his fate of being obliged to wait until the death of her uncle should bring about a change in domestic matters.

And yet, knowing Claude Shute as Mary did, in spite of all, he seemed to her the very last man to commit such a deed in cold blood. Once, only once, had she learned that he had a temper at all, but when he left her on this fatal afternoon, she remembered that it was far more in sorrow than in anger.

On the other hand, if Claude Shute did not do it, who else could have possibly gained by such an act? Dick's temper was much more of the kind which might lead to the committal of a terrible act such as this than was Claude's, but Dick would have gained nothing which was not his already. Then an after-thought came to Mary's mind: was it possible that Claude Shute could have murdered Jethro Seaton with the idea that suspicion would at once be directed on Dick, and that by so doing not only would he gain his object and put an end to the weary waiting for Mary, but would be rid of a seemingly implacable enemy?

Impossible! Impossible! The girl scouted the thought immediately after its occurrence.

In due time Jethro Seaton's will was brought by the family lawyer. Mary watched her brother's face as he read it. It suddenly darkened, and he pointed to the clause: 'And to Claude Shute I bequeath the sum of five thousand pounds free of legacy duty.'

Mary's heart sank, and she knew what her brother was going to say.

'Mary,' he said, 'Claude Shute murdered our poor old uncle. What I have always said to you about him is true—that he was a fawning, scheming humbug. Now you can see why he was so fond of uncle, and now I can see why he got rid of him.—Where is he now?'

Mary was so overcome with emotion that she knew not what to say. Could it be, she asked herself, that her Claude, the man whose lips had so often pressed hers, whose ring was still on her finger, that he was, as it seemed, merely a desperate schemer and fortune-hunter; that his mouth had spoken what had never been in his heart; and that he had murdered this poor old man merely to hasten the acquisition of a few thousand pounds?

At that moment the servant came in with a letter. Dick snatched it from the tray; it bore a foreign stamp, and was addressed in Claude's writing. He tore it open, and read:

Hotel Royal, BOULEVARD ANSPACH, BRUSSELS.

MY DARLING MARY—If I must wait, I must do so in exile. I cannot be so near the fruit to attain which I have laboured so long, and feel that I must not touch it. Moreover, I dare not trust myself longer in the neighbourhood of the bulldog. You do not know me as an ill-tempered man; but I can be roused, and I feel that he will rouse me, and then I know that I shall say or do something which will render the gulf between him and me, wide as it already is, impassable. I do not know where I shall go from here; but if you want me,

write to this address, and wherever I am, the letter will reach me. In great haste to catch the post, with kindest love to yourself and very kind regards to your good uncle.—Believe me, ever your affectionate

CLAUDE SHUTE.

'Sly blackguard!' was Dick's comment upon this epistle.—'I'm the bulldog, I suppose, and he dares to threaten me! And pretending not to know anything about what has happened. Penh! It's sickening.'

'Dick,' said Mary quietly, after she had read the letter two or three times, 'in spite of all you say, that is not the letter of a guilty man. Nor do I think the fact of his going abroad condemns him.'

'Don't it? By Jove, I think it does, though!' exclaimed Dick. 'He's gone, so that he can plead an alibi, should suspicion be directed against him. He's a clever fellow; but he wasn't clever enough to calculate upon the evidence which could be got out of a broken watch.'

Mary had spoken from her heart and in firm belief when she gave her opinion that there was nothing suspicious either in the fact of Claude's going away or in the tone of the letter. She could not believe him guilty, although appearances were so terribly against him that she admitted to herself that had he not been her lover she would have condemned him.

'That was why he got away,' continued Dick, who was striding up and down the room with a brow as black as night. 'He knew that suspicion would immediately be fixed on me; and it was just his game to get me out of the way, and to marry you with all poor old uncle's money.—But what's the use of wasting time in discussion? We must act, and that immediately.'

'What are you going to do, Dick?' asked Mary in an agonised voice.

'What am I going to do? Why, put this letter in the hands of the Scotland Yard fellows, have a warrant drawn up, get him arrested, and—hanged!' replied her brother bitterly.

'Don't, Dick—for my sake, don't,' implored the girl.

Dick stopped short and looked at her. 'For your sake, don't!' he repeated. 'Then you know him to be guilty, and you are trying to screen him. If he is innocent, as you say he is, let him come and prove it in fair trial.'

'But appearances are so much against him,' urged the girl. 'Consider, Dick, if that watch had not been found, appearances would equally have been against you.'

'Very well; then I should have asked to be tried,' replied her brother. 'If the man's innocent, it will be proved.'

'Stop! stop! only for a few moments,' cried Mary. 'I can't think he did it! And yet—O my God, my heart will break!' And, utterly overcome by her emotions, she sank to the ground, weeping bitterly. Her brother, having a wholesome contempt for feminine grief in general, and for his sister's ebullition upon this occasion in particular, did not offer to raise her, but left the room.

Mary remained for some minutes prostrate. Suddenly she sprang to her feet. 'I must save him!' she said to herself. 'No one knows yet that he is suspected. If I telegraph to him, he

will have time to get away before the detectives can reach him. I may be doing wrong; pray God I am not; but I am sure he is innocent, although I am as sure that he would stand no chance before a jury.' She ran up-stairs, put on her hat and cloak, and rushed through the gardens by a path which led to a gate in the wall opening on to the village street. What people thought to see her flying along dishevelled and wild-looking, she cared not, but, as if she was the criminal, crept swiftly by back lanes until she reached the railway station. Three times did she write the telegram: three times she tore it up as being absolutely illegible. The fourth time she succeeded better, and handed in:

'From Ottery, Colyton, to Shute, Hotel Royal, Boulevard Anspach, Brussels.—Fly for your life immediately on receiving this.' The clerk looked at her after he had read it.

'It's—it's a cipher,' she stammered; 'Mr Shute will understand it.'

She placed a sovereign down, and rushed away, for the up-train would be due in a few minutes, and she guessed that Dick would go by it.

'Poor Miss Ottery,' said the station-clerk. 'If that there affair at the 'All ain't touched her 'ead, I'm mistook; she's been an' left her change behind her, an' one 'ud think there was ghosts arter her by the way she run in.'

SLEEP AND SLEEPLESSNESS.

AMONGST the peculiarities which belong to man, and man only, there is none perhaps which exercises such a widespread or important influence as sleeplessness. Advancing civilisation has so far only increased it; and science, although it has made some valuable contributions to the immediate cause of sleep—that is, the mechanism in the body by which it is produced—stands almost powerless with regard to removing sleeplessness from the category of human ills.

There is scarcely anything upon which so many dogmatic and yet varying opinions are expressed as the amount of sleep required by individuals. There are many who consider the Great Alfred's division of time into eight hours for labour, eight for amusement, and eight for sleep, as the best possible one. Others, again, cite instances of great men who have influenced the world and yet have taken very little sleep, as showing that eight hours is too much. The elder Descroilles is perhaps the most extreme example, having slept but two hours in the twenty-four; Jeremy Taylor comes next with an allowance of three hours; then Baxter and Wesley with four and six hours respectively. But it is useless to attempt to adduce any rule from isolated examples; the individual wants in each case must be considered, and nature is the surest guide in indicating how much sleep is necessary for the purpose of resting the brain and repairing the nervous system. Some, no doubt, indulge themselves too freely, as was the case with the medical student who started the strange theory that sleep was the natural condition of man, and therefore slept eighteen hours a day, until he died in consequence of apoplexy. Others, again, with an almost overpowering tendency to somnolence, have seen the

wisdom of keeping it in check, and been to some extent rewarded. Lord Hailes, when composing his *Annals of Scotland*, constantly resorted to a wheel-chair he kept in his study, that he might be driven rapidly about by a servant, to dispel his disposition to slumber, and in church could only keep himself awake during the sermon by crunching sweetmeats. Dr Johnson had to fight against the same tendency; and Thomson, the author of the *Seasons*, passed an undue proportion of his time in bed. There are some people, again, who can sleep or wake at will. Napoleon Bonaparte is an example, as was also Quin the actor; and another occurs in Captain Barclay, who walked a thousand miles in a thousand consecutive hours, dozing regularly off to sleep when he had completed his mile, and waking in time to renew it. Plenty of instances also abound where sleep has been indulged in under the least favourable circumstances. Sir Walter Scott has told us how the North American Indians, when at the stake of torture, will sleep on the least intermission of agony until the fire is applied to waken them. Many have slept on the rack. Poor little factory children have fallen asleep from sheer weariness, and yet continued to move their hands and fingers as if at work. Soldiers have slept during a march, as in the case of those retreating with Sir John Moore from Corunna; whilst others, again, have slept sound with the roar of artillery around them.

Still, in spite of the fact that the absence of sleep cannot long be healthfully sustained, and that we can bear the privation of fire, food, and even drink, longer than we can the want of sleep, the utmost misery from sleeplessness is a common and familiar occurrence. The remedies which have been proposed for it would fill a volume, all sometimes as impossible and as irritating to the sufferer as the Chinese recommendation, to divest the mind of all unpleasant images, painful reminiscences, retrospective sorrows, and prospective griefs. The most celebrated and perhaps the most efficacious method for procuring sleep that has been devised was originated by a Mr Gardner, who, amongst other things, had remedies for many evils, such as for allaying thirst where no liquid element could be procured, for improving the eyesight by various ingeniously contrived glasses, and for appeasing hunger. His sleeplessness, however—resulting from a severe spine injury in being thrown from a chaise—had been almost intolerable for years, until he discovered a means, which never afterwards failed him, of commanding sleep at will. The discovery caused some stir at the time, and many eminent persons adopted it, and gave testimonials as to its efficacy. Now, however, that it has dropped almost out of existence, it may be a boon to many to have its formula reproduced. The sufferer who has wooed sleep in vain is, according to Mr Gardner, to lie on his right side, with his head comfortably placed on the pillow, having the neck straight, so that respiration may not be impeded. The lips are then to be closed slightly and a rather full inspiration taken, breathing through the nostrils as much as possible. The full inspiration taken, the lungs are to be left to their own action. Attention must now be fixed upon the respiration. The person must imagine that he sees the breath passing from his nostrils in a continuous stream,

and at the instant he brings his mind to conceive this apart from all other ideas, consciousness leaves him—or at least so says the recipe—and he falls asleep. If this method does not at once succeed, it is to be persevered in, and if properly carried out, is believed to prove infallible. It is founded on the principle that monotony, or the influence on the mind of a single idea, induces slumber; and, as such, is but another form of different methods which are familiar to a great many.

Sir Thomas Brown found it a most effectual soporific to repeat some verses on which the well-known *Evening Hymn* was founded. Rabelais tells us of some monks who, when wakeful, resolutely set themselves to prayer, and who, before they had concluded half-a-dozen aves or paternosters, fell asleep. Franklin took his air-bath; Sir John Sinclair counted; whilst Sir John Rennie, when engaged on public works, never went to sleep without previously having his hair combed at the back of his head with a fine tooth-comb and rubbed gently with the palm of the hand. Combing the hair, brushing the forehead with a soft shaving-brush, or fanning, all are good as sleep-inducers, and might well be tried on sleepless children, although perhaps the Spanish practice of getting babies off to sleep by rubbing the space between the cervical and lumbar vertebrae—that is, between the neck and the waist—with the hand, as it is reputed never to have failed, would be a shorter road to the same goal.

We are considering the question, it must be understood, without taking such potent remedies as narcotics into account, for their administration requires the skill and the supervision of a medical attendant. One or two remarks, therefore, as regards the reason of Mr Gardner's formula may induce some to have more faith in what at least can be nothing but a harmless and easy plan. The direction to lie on the right side is supported by the knowledge that the heart, being more towards the left side of the thorax, has freer action when the body rests on the right. The advice to breathe through the nostrils as much as possible, although scientifically approved, is one which civilised people rarely adopt. The wild Indian's mother makes a practice of closing her babe's lips when asleep, and thus induces the habit of breathing through the nose, which nature has provided with a special apparatus whereby the air is warmed before it passes to the lungs. But so much have we deviated from this healthful and natural practice, that Mr Gardner qualifies his advice to breathe through the nostrils by saying, 'as much as possible.'

One of the most effectual means of preventing wakefulness is, however, to remove the cause. It may be said that none but the patient can minister to 'a mind diseased,' that no one can at all times fly from or avoid great mental pain, or, in fact, an amount of physical pain sufficient to keep a person awake. But sleeplessness is often the result of far simpler causes. A bright light in the room, an unaccustomed noise, an uncomfortable bed, are causes which suffice to keep some people awake. Any strong intellectual effort, such as an exciting game of chess just before retiring to rest, will keep the circulation in the brain at such an unnatural tension that sleep is impossible. Tea and coffee cause

wakefulness also, by the increased activity in the circulation, just as much as cold, which produces a derangement in the circulation and a certain amount of discomfort. Remedies for all these are, as a rule, in every person's power, and only require the exercise of a little thought. A sensation of dry burning heat in the soles of the feet and palms of the hand, which accompanies certain diseases in some people, is another cause of sleeplessness; but that will give way if sponging the parts with vinegar and water is resorted to. Where wakefulness is the result of exhaustion from want of food, a glass of cold water or pale ale, or the eating of a sandwich, will, by setting up activity in the abdominal organs, divert the superabundant blood from the head, and thus draw off the source by which the unnatural activity of the brain was sustained. Another cause of sleeplessness, which is, however, too little recognised, is the taking of stimulating drinks; and in this, an effort of the will to forsake the habit is all that is necessary in the way of a cure.

The effects of protracted wakefulness are such that the strongest constitution cannot resist them, and it therefore becomes all to try to overcome a habit which may have very serious consequences. Newton's mind was impaired by the privation of sleep in his old age, and the mental stupor which darkened the closing years of Southey's life was preceded by it. But perhaps one reason why the most gifted minds have been afflicted by wakefulness is, that bodily exercise is too often neglected by people devoted to intellectual pursuits. There is no better soporific than plenty of outdoor exercise, carried even, in extreme cases of wakefulness, to a sense of fatigue. Horace, in his *Satires*, recommended the swimming of the Tiber three times as a means of procuring deep repose; and the science of the present day, with all its array of facts, has little better advice to give.

THE DEADWOOD COACH.

ITS EARLY HISTORY—ATTACKS BY INDIANS AND HIGHWAYMEN.

THE late performances of the 'Wild West' at the American Exhibition, and the introduction of the Deadwood Coach, have suggested that useful, though by no means ornamental or comfortable, conveyance to me as the subject of this sketch. As my acquaintance with it extended over a period of eight years, I feel competent to give its history, and can at the same time vouch for the facts.

As early as 1876, the Deadwood Coach made its first appearance on the streets of Cheyenne, a frontier city on the Union Pacific Railroad, distant about three hundred and twenty miles from the metropolis of the Black Hills. This route was stocked and equipped by Gilmer, Salisbury, & Co., a stage Company well known throughout the West, who afterwards also stocked the Sidney route, with the town of that name as its southern terminus, also on the Union Pacific Road, but east of Cheyenne, and a shorter distance to Deadwood. The first named accommodated passengers

and mails from the west, and entered the Hills from the south and on the west side; while the latter accommodated travel from the east, and entered the Hills from the south and on the east side. Early in 1877 the North-western Stage Company stocked and equipped a route from the north-east, with Bismarck—situated on the Missouri River at the point where the Northern Pacific Railroad crossed that stream—for their eastern terminus, distant also about three hundred miles. This route accommodated the travel from the north-west and steamboat passengers. In 1881 this last-named route was abandoned, and the stock transferred to the Pierre route, the shortest of all, being only two hundred and ten miles, when the Chicago and North-western Railroad Company extended their road to Pierre on the Missouri River, and afforded the most direct road from Chicago to Deadwood.

Besides these routes, one from Kearney Junction, Nebraska, the western terminus of the Burlington and Missouri River Railroad, a point two hundred miles east of Sidney, and over four hundred miles to Deadwood, was established in the early spring of 1877, and operated by a banker named Dake. This stage-line, though, had a short life; the road was necessarily located through the great Sioux Reservation; and although the treaty with the Sioux provided for such a highway, yet the Indians themselves, while not objecting very strongly to the Sidney route, were very much enraged at both the Bismarck and Kearney; and a few months after the latter was first located, and while it was still in its infancy, the Indians murdered one of the drivers, and acted in such a threatening manner that the proprietor made an appeal to the government for military protection. This, however, was refused, and he withdrew his coaches and stock.

The Indians then turned their attention to the Bismarck Road; they stole a good many of the Stage Companies' horses, and, despite the fact that each coach was accompanied by an armed outrider and guard besides the driver, they succeeded in 1877 in taking possession of one, rifling the mail-pouches, and attempting to break open the steel safe in which valuable express packages were carried; but their efforts proving futile in this, they left the coach in disgust, taking the horses with them. The passengers, driver, and guard were fortunately enabled to escape by hiding in a dense thicket at the side of the road; and the Indians perceiving a large mule-train a short distance off, left without making any attack on the thicket, which otherwise they would undoubtedly have done. In the face of a larger force, the redskins are very discreet and cowardly, especially if that force is made up of frontiersmen, their mode of attack being always in the shape of a surprise unless their numbers far exceed that of the opposing party. Again, in '77 a party of Sioux chased another coach on the same route, and made life very uncomfortable for the passengers, driver, and guard by a continual shower of arrows and bullets; but this time the only escape for the occupants was in flight. The four-horse team, however, proved their mettle by distancing the ponies ridden by the Indians, and carried their load safely to the stage station, where plenty of

help was at hand to withstand an attack. After this, the Indians gave up bothering the coaches, and satisfied themselves by attacking small emigrant outfits and stealing horses.

But if the Sidney and Cheyenne coaches escaped molestation by the Indians, the highwaymen (called road-agents) made up for it. On these roads, in '77 and '78, it was almost the rule for the passenger coaches to be 'held up' somewhere *en route* by these modern Dick Turpins, who would spring from the earth as it were, and notify the driver of their presence by a loud command to 'halt;' and as their appearance was so sudden, they had the 'drop,' and the command would be complied with. Then the passengers would be ordered to alight with their hands up, receiving the cheering intelligence from the leader, backed by two revolvers ready cocked, that any attempt to drop their hands would be followed by instant death. Standing in a row with hands elevated over their heads, they would have to await their turn to be searched, which was performed in a most scientific and systematic manner by members of the gang, who usually were not content with rifling the pockets of their victims, but, as a rule, made them remove their boots, socks, and outer garments. These, however, they were allowed to resume after the departure of their unwelcome guests. Ladies were treated gallantly, the leader of the road-agents often accepting a kiss as payment of the toll extorted from travellers; but in case of refusal of this favour by some belle who disliked having her lips polluted, a systematic search was the result, and her money and other valuables went to fill the coffers of the desperadoes.

The position of these passengers can be described, but must be experienced to be appreciated. One can fancy being awoke in the middle of the night on the prairie, with no shelter or assistance near, and ordered by masked men, armed with revolvers and shot-guns, held cocked in a seemingly careless manner close to your head, to undress and give up all your valuables; and most probably, too, the weather was inclement, for bright moonlight nights were rarely chosen to hold up a coach. The position, as I say, must be felt to be thoroughly appreciated. The mail-pouches were not forgotten, but were usually carried off, the contents carefully sorted out, and any letters supposed to contain money appropriated, and the pouches left somewhere on the road for the next coach to pick up. Usually, these gangs of road-agents numbered five or six; but it is on record that in many instances one man has done all the work, and most thoroughly too, assisted by a number of dummies arranged near the road, armed with long sticks, which to the frightened men and women just rudely awakened, bore a most unpleasant resemblance to rifles. Many a reader will say: 'But how is this possible? I thought every passenger would carry arms and fight.' True; mostly every one did carry weapons, and I have heard many tell beforehand the reception they would give a road-agent; but very rarely did it happen that, when the command to halt was given, any of these braves could get their weapons in readiness. In fact, a man cannot tell what he would do until the time comes, and then usually acts in just the opposite manner from that he had expected.

The two attacks which received the most attention and provoked the most determined pursuit were made on the Cheyenne road in the early spring of '77 and the autumn of '78. The first occurred on Whitewood Creek, about four miles south-west of Deadwood. The coach had a full load of passengers, who, rejoicing that their long journey from Cheyenne was nearly completed without molestation, were looking forward to the good supper and warm bed awaiting them at their journey's end. The driver, Johnny Slaughter, one of the best in the Company's employ, was handling the reins over his four spanking horses, and carefully guiding them over the rocky road while he talked with or listened to the remarks of the occupant of the box-seat; when suddenly, without the slightest warning, the report of a gun was heard, and poor Slaughter fell forward, mortally wounded. The horses took fright, and ran off in the direction of Deadwood at a break-neck speed, threatening to hurl the coach either over the rocky bank into the creek on one side, or against the large pine-trees on the other; but, more by good luck than good management, for a passenger had succeeded in getting hold of the reins, took the ill-fated coach safely into Deadwood. A determined pursuit ensued; but to this day the murderer of Johnny Slaughter has never been captured, and the mystery remains unsolved as to why any road-agent should deliberately murder the driver of the coach; for usually these men were unmolested even after refusing to obey the command to halt, the bullets in that event being directed against the horses. The road at the place of attack was very rough, the timber and bush on the side from which the shot was fired being very dense, while the steep and rocky bank of the creek on the opposite side was sure evidence that the point had been selected by an experienced hand, but by which one of the numerous gangs that infested the country at that time has never been ascertained.

The other attack was made on the ironclad treasure coach, one built expressly for conveying the gold bullion from the Hills to the railroad. It was a beautiful afternoon in the autumn of '78; the stock-tender at Canyon Spring Station, thirty miles south-west from Deadwood, was awaiting the arrival of the ironclad; his change of four horses stood in their stalls ready harnessed, and impatiently awaiting their daily drive. The station was one of the most secluded on the road, the nearest house being ten miles distant. The single log building formed shelter for the stock-tender, the only inhabitant, as well as the horses under his charge. The location on a rocky ledge at the head of a deep canyon, with a background of heavy timber and underbrush, was one of the most suitable for a tragedy, and the lonely position of the stock-tender one not to be coveted; but he appeared well contented, and happy as he sat outside the log building, smoking and reading an old illustrated paper that one of the drivers had good-naturedly supplied him with. But he starts to his feet as he hears horse's hoofs treading the rocky road just in time to salute a stranger well mounted and armed, who politely requests a drink of water.

Without hesitation the occupant turns into the stable to get a drink from a bucket set

in a cool place, and with the tin cup starts again for the open air. But the air of politeness has left his stranger visitor, and besides he has been joined by eight companions, all as well mounted and armed as the first; and as the stock-tender steps to the door with the water, he is considerably taken aback at the sight which meets his view: nine rifles are pointed directly at his head, and he is commanded to throw up his hands at once. This done, a rope is found, and his hands and legs pinioned securely, a gag placed in his mouth, and without ceremony he is tossed into a manger. His captors then knocked out the mud chinking between the logs in the front wall of the stable, and with the muzzles of their rifles inserted in these temporary portholes, awaited the arrival of the coach.

Their plans had been well matured, and they evidently know what they have come for, and are prepared to take desperate means to obtain their booty. The coach is driven to the stable without any intimation of the reception awaiting the occupants, who ought to be six or seven in number, well armed, and on the look-out for attack. But by an accident, this particular coach has a short number of guards, only three regulars, besides one volunteer in the shape of a telegraph operator named Campbell, who, being pressed for time, entreated the agent at Deadwood so earnestly to allow him to go out on this coach, that, despite their orders to the contrary, he was permitted to do so. As Gene, the driver, stopped his horses, and Gale Hill, one of the guards who rode beside him, rose to dismount, a volley was fired by the men concealed in the building, and poor Campbell, who was sitting on the middle seat in range of the porthole in the iron door of the coach, fell dead with three or four bullets in his body. Gale Hill also was wounded in several places, but managed to crawl to the rear of the building, where, through a window, he opened fire on the robbers, but in a few moments dropped from loss of blood, and was afterwards found in the grass nearly dead. The other two guards managed to scramble out of the coach on the opposite side from the stable, and took refuge behind the trees, where they were overcome by the robbers and disarmed. Gene, who had fortunately escaped, but not left his driver's seat, was ordered down, and forced to walk in front of them towards the trees behind which the guards had taken refuge. Here he, too, was disarmed, leaving the road-agents entire masters of the situation. The coach was at once relieved of its load of bullion, valued at about twenty thousand dollars; and the road-agents separating, and carrying with them the gold bricks, escaped. Gale Hill, after a long and serious illness, recovered, and resumed his occupation as guard.

Notwithstanding that a determined pursuit after the robbers was made by a large party, headed by Ed Cook, the superintendent of the Stage Company, yet only two of the gang were convicted, although all the bullion taken was recovered.

After this last attack, men suspected as road-agents were evidently of the opinion that the country was not a healthy one, especially as three of the worst had been hanged by Vigilance Committees about this time; and from that time on,

but little trouble was given by the balance of the suspected men, and the passengers to and from the Hills could travel in comfort so far as attacks from highwaymen were concerned.

THE 'BATTLE' OF BOSENDEN.

AN INCIDENT IN KENTISH HISTORY.

BOSENDEN is an old-fashioned farmstead, situated in what our American cousins would call a 'clearing,' in the picturesque woodland district known to Kentish men as the Forest of Blean, which extends from the valley of the Stour to the shores of the German Ocean. Only once in the course of its history has Bosenden Farm been aroused from the peaceful quietude which seems naturally to attend a secluded spot, nearly surrounded by the woods, with the sea rolling calmly in the distance. That one exceptional day was Thursday the 31st of May 1838, just fifty years ago, when the 'battle' occurred which we propose to describe.

The ancient city of Canterbury—from which Bosenden is distant about five miles—was startled in the autumn of 1832 by the arrival of a stranger, who took rooms at one of the principal hotels in the city, and soon contrived to make himself the centre of attraction in the neighbourhood. He announced himself as Sir William Courtenay, Knight of Malta, a member of the well-known Devonshire family bearing the name which he assumed. In dress, manners, opinions, and general style of living, it was apparently the main object in life of this gentleman to act as differently as possible from the multitude around him. He wore his hair in long locks, floating over his shoulders, with a beard and moustache, which were appendages unknown among Englishmen in those days, assimilating his appearance as far as he could to the portraits of our Saviour. He dressed in various costumes of an oriental type, often appearing in a tunic and cloak made of red velvet, adorned with embroidery, and was armed sometimes with a sword, sometimes with pistols stuck in his girdle. He was an expert horseman, and constantly rode about the neighbourhood.

Doubts were entertained from the first as to whether this personage had any claim to the name by which he called himself; but it was evident that he was a man of excellent abilities, an eloquent speaker, one who had travelled much, and mingled with the best society. Those were the days of the first Reform Bill, and Sir William Courtenay soon came before the East Kent public as the editor of a newspaper devoted to advocating the interests of the people, which was called the *British Lion*, and was headed with a representation of that animal in a most ferocious attitude. Several copies of this paper are in the writer's possession, and are well worth study as a literary curiosity. The title-page is headed with texts and mottoes, such as, 'Justice to the Poor, Justice to the Rich'; 'The British Lion will be Free'; 'Heaven is his Throne, the Earth is His Footstool'; 'The Root of all Evil is in the Church'; and others of similar character. Encouraged by the success of his journal, Sir William aspired to a place in the House of Commons; and when a vacancy occurred in the representation of Canterbury towards the close of the year 1832, he was

one of the candidates for the vacant seat. He was not successful; but he polled a large number of votes, many influential persons in the neighbourhood being among his supporters.

For several months Sir William was the greatest 'lion' in Kent. But in the following year an untoward event put a temporary stop to his public career. He was tried and condemned for perjury, in giving evidence at a trial of some local smugglers, on behalf of whom he had come forward as a witness, and was sentenced to a term of imprisonment. His place of captivity, however, was shortly changed from Maidstone gaol to Barming Lunatic Asylum, as those who were in charge of him believed that he was not quite accountable for his actions. At the asylum he remained in confinement for about four years, until he was released at the solicitation of his relatives in the west of England, who were now found to be not the Devonshire family of Courtenay, but the Cornish family of Thom—the self-styled Sir William being the son of a gentleman of that name, and his proper name being John Nicholls Thom.

Soon after his release, Sir William, as he was still called in East Kent, came to revisit the scene of his former adventures, and stayed for some time at the house of Mr Francis, a country gentleman living at Boughton, on the western side of the Forest of Blean, some six miles from Canterbury. Sir William now commenced a second edition of his career as a social reformer. Resuming his old dress, he spent day after day in visiting the villages in the Blean district, making the acquaintance of the villagers, and inspiring them gradually with an intense attachment to himself. At that time, a considerable part of the 'forest' had never been formed into a parish, but was an extra-parochial district—or 'ville,' as such districts are called in Kent—without church or school or any religious or educational organisation, known as the Ville of Dunkirk. Gradually Sir William added to his character of social reformer that of an inspired prophet and religious teacher. Gifted with great natural eloquence, and possessing many of the qualities needed in a leader of men, he was quite as successful in this rôle as in the former one which he had assumed. On one or two occasions he celebrated religious rites, such as blessing little children, anointing his followers, and administering a communion of bread and water. In a short time Courtenay had gathered round him a numerous and devoted band of adherents, some looking upon him as a reformer who would redress the wrongs of the poor and oppressed; and others regarding him as a teacher and saviour sent from above. Mr Francis warned Courtenay against making any dangerous use of the influence which he had gained among the peasantry, and soon after bade good-bye to his guest, who then took up his quarters at Bosenden Farm, occupied at that time by a farmer named Culver, who was one of Courtenay's firm adherents.

Bosenden Farm now became for several months the centre of a movement which was socialistic in one aspect and religious in another. Still, nothing was done which could bring Courtenay or his followers into collision with the law of the land. Such a collision was, however, seen to be inevitable, and at last it came. For the

account of what follows the writer is indebted to a history in manuscript, penned at the time by the Rev. C. R. Handley, then vicar of Hernhill, a parish in which Courtenay had gained a large number of adherents.

On the afternoon of Sunday, May 27, 1838, Courtenay preached before a large congregation on Boughton Hill, half-way between Canterbury and Faversham. He chose as his text, 'Go to now, ye rich men, weep and howl for the miseries that shall come upon you;' and on these words he based a discourse of a very inflammatory nature. The outcome of it was seen on the following Tuesday morning, May 29, when Courtenay, mounted on horseback, and followed by a crowd of his adherents, went in procession through the villages of Hernhill, Goodnestone, and Boughton, exhorting people to join his standard, and bearing a loaf of bread carried on a pole, as an outward and visible sign of the plenty which his followers would secure. On the following day, Wednesday, a procession of a similar character was formed through Selling, Sheldwich, Throwley, and other places lying on the south side of the London and Dover Road. Meantime, the local magistrates had been in consultation, and warrants were issued for the apprehension of Courtenay and two of his followers.

Early on the morning of Thursday, May 31, John Mears, a constable, went to Bosenden Farm to execute this warrant, accompanied by his brother Nicholas and another man. That morning witnessed a scene of extraordinary excitement at the usually quiet old farm. At an early hour, Courtenay assembled his men and harangued them with even more than his usual earnestness: he told them that he had come from heaven, and that on that day he was going to usher in the millennium and put an end to all injustice and oppression. He promised those who followed him and had been anointed by him that they should be invulnerable if any troops should attack them; and asserted that even should he be slain, he would, like our Saviour, rise again on the third day. He administered a communion in bread and water, and received the homage of his followers, two of whom even fell down and worshipped him. Presently he fired his pistol, which he had loaded with tow and particles of iron, into the air, and as the bright particles descended, a strain of music was heard in the distance. This appears to have been a skilful device contrived for the occasion, the music really proceeding from a flute played by one of his adherents concealed in the wood. It is a proof of the powerful hold which Courtenay had obtained over his followers, that some of them firmly believed that he could tell all that they were doing, even when at a distance from him.

Mears, the brother of the constable, on arriving at the farm, began to remonstrate with Courtenay concerning his conduct, before getting his brother to produce the warrant. Courtenay imagining that it was the constable who was speaking to him, fired at him, and killed him on the spot; and at his command, his followers seized the body and threw it into a ditch. War was now openly declared against the constituted authorities. But the campaign was a brief one: the day that saw it open witnessed its close. After breakfasting with his followers, Courtenay

proceeded for another triumphal march through the neighbourhood, marching on this occasion to the house of his former friend, Mr Francis, where he supplied his men with refreshments at that gentleman's expense; after which, he retired again to Bosenden, and encamped in the woods near the farm.

The news that Courtenay had at last defied the law and shot the brother of the constable spread on rapid wings. One messenger had gone in haste to the nearest magistrate, and another to the barracks at Canterbury for a force of military, in case they should be needed. About mid-day, Sir Norton Knatchbull, Dr Poore, and two other magistrates, appeared, together with Major Armstrong, Lieutenant Bennett, and one hundred men of the 45th Regiment from Canterbury. According to a plan made at the time, which is in the writer's possession, the insurgents were found encamped a short distance north-west of Bosenden Farm, in a valley through which a tiny stream meanders—not far from the boundary-line between the estates of which at the present time the respective possessors are Mr E. S. Dawes and Mr G. B. Gipps.

As to the exact details of what followed, the evidence is, as might be expected, rather conflicting; but on comparing accounts, we gather that Courtenay's party were found to number rather more than a hundred men. They were all armed with heavy sticks and bludgeons, and as soon as they perceived the arrival of the soldiers, they put themselves in a defensive attitude. On coming to close quarters, Lieutenant Bennett, a young and gallant officer, stepped to the front and called upon Courtenay to surrender himself. Courtenay replied by stepping forward in his turn and instantaneously firing upon the lieutenant with such a true aim that the young officer fell dead on the spot. One of the soldiers, seeing his officer fall, at once fired, and Courtenay fell dead. Courtenay's men, nothing daunted, at once attacked the military, and a desperate conflict ensued. The insurgents fought with a courage which did credit to the training which they had received from their leader; and the fight was prolonged for some time. It was mid-day when the soldiers arrived, and they did not return to their quarters until seven o'clock in the evening. Courtenay's followers were, in spite of their efforts, overpowered by the disciplined force; and when the combat was over, it was found that on the side of the rioters eight had been killed and seven severely wounded; while on the side of the military two had been killed and six had been wounded. Add to these casualties the death of Mears in the early morning, and the results are seen to be severe for this insurrection of a day.

The bodies of the slain were carried to the nearest inn, the *Lion*, in the Ville of Dunkirk. We need not dwell on the inquests which were subsequently held; but we must linger for a moment upon the events of the day on which Sir William and his deceased followers were buried in the quiet churchyard at Hernhill, about two miles from the scene of the 'battle.' The body of Courtenay remained at the *Lion* until the morning of Tuesday, June 5, during which time it was visited by at least twenty thousand persons, many of whom seemed to be under the

impression that within a few days the dead man would fulfil his promise of rising again. But when more than a week had passed, these expectations began to subside. The funeral took place in the morning, in the presence of about one hundred and twenty persons; the usual service was read, but the body was not taken within the church, nor was the bell tolled; and when the burial was over, no mound was raised to mark the exact site of the grave, though the spot is still pointed out by old inhabitants. The entry in the parish register book is worded thus: 'William Courtenay, alias John Tom, no known residence; age unknown, supposed about 42; buried June 5th, 1838.'

In the afternoon of the same day, a more melancholy ceremony took place: the burial of six of those who had fallen at Bosenden: the oldest a man of sixty-two; and the youngest being only twenty-three years of age. The melancholy service lasted almost two hours. The village was a universal scene of mourning, and the clergyman was so overcome with emotion that it was with difficulty that he proceeded with the service. All of these persons were buried with the usual full service, which was used separately for each one.

So ended the movement which culminated in the 'Battle' of Bosenden. For many years afterwards persons still remained cherishing a lingering belief that Courtenay was in some sense a messenger from heaven; but this was gradually effaced by the lapse of time. Several of the leading rioters were tried, and condemned to death; but they were all pardoned, and their sentences commuted to transportation or imprisonment. Two beneficial effects, one of a local, and one of a national character, were the indirect outcome of the events above narrated: the forming of the district of Dunkirk into a parish, with its schools and church and other humanising influences; and the legislation on behalf of national elementary education, which received a great impetus from the discovery of the ignorance prevailing in rural districts, which was revealed by the evidence at the trial of the rioters.

ACOUSTIC VASES.

THE theatres of the ancient Romans were notable for their good acoustic properties, due to the fact of their interiors being constructed of wood, a material which by its own vibrations reinforces sound. Those of the Greeks being built chiefly of stone and marble, were wanting in this important respect; to remedy which, they were compelled to call in the aid of resonance, which they did by placing a series of hollow brazen or earthenware vessels, of carefully graduated sizes, between the rows of seats in the auditorium.

Vitruvius tells us that these harmonic vases were placed in cells or niches between the rows of seats occupied by the spectators, to which the voice of the actor had free passage, and that they enabled the actors to be heard in all parts of the gigantic theatres, some four hundred feet in diameter; that they were made of brass or earthenware, and proportioned in magnitude to the size of the building; and that in the smaller theatres they were tuned in harmonic proportions of

fourths, fifths, and eighths, with their replicates; while in those of greater magnitude there was a vase to correspond with every sound in the diapason, or great musical system, in all the genera. Unfortunately, he does not give any description of their form, which in all probability resembled that of bells. These vessels, termed *ècheia*, were found greatly to strengthen the speaker's voice, especially when the dialogue was intoned; and here we have probably the philosophy of the origin and practice of intoning our church services. Each *ècheion* selected a certain note, like the pipe of an organ, and vibrating in unison with it, responded and took up the sound by sympathetic vibration, thereby increasing its intensity. Any hollow air-space will accommodate itself more or less in the same manner, a fact that is now generally taken advantage of in our theatres and public buildings, by leaving open spaces beneath the seats and floors, between the walls and above the ceiling.

It is of very recent years that the study of acoustics has received the attention due to it, and that such rude expedients as these sonorous vessels have given way before the steady advance of science. In the year 1850, an open plastered drain about a foot square in section was discovered beneath the chancel floor of St Peter's Mancroft, Norwich, running under the stalls on either side; and built into both sides of the drains, about three feet apart, were red earthenware jars, resting on their sides, with their open ends projecting two or three inches into the drain. They measured about nine inches in height, six inches across their ends, and eight inches at their middle part, and their insides were glazed. Ten years later, the same arrangement was found at another church in the same city, St Peter's Mountergate, with the slight difference that the jars had handles; and instead of being laid opposite to each other, as in the former case, they alternated on either side of the drain. A similar discovery of acoustic pottery was also made at Fountains Abbey.

When the new Opera-house was built at Turin in the middle of last century, all the architects, mathematicians, and men learned in harmonics and the philosophy of sound, were consulted as to the form and situation of these harmonic vases; but no clear idea either of their construction or principle was arrived at. Trial vases were, however, placed in the house, as well as in others in various parts of Italy, but without the effect expected from them of augmenting the tone of the human voice, and of the instruments to which they were tuned. In a small private theatre, where it was hoped to propagate and clarify the sound of choral music by their means, the result was a resonance, like the sound produced by sea-shells when placed against the ear many times multiplied, and growing like the sound of a gong, a powerful and perpetual hum; so that whenever anything was said or sung in the building, it was necessary for the time to remove the *ècheia*.

This shows that great care and not a little knowledge is necessary in applying the principles of acoustics, another incident in confirmation of which was published in the *Philosophical Magazine* for 1830. 'A church had been erected in Sheffield in which the preacher was altogether unheard,

however great his exertion. Various unsuccessful expedients were tried, until the incumbent, happily in this case a scientific man, had a large parabolic reflector of light wood constructed and so suspended that the pulpit was in the focus of the parabola. By such an arrangement, the rays of sound issuing from the focus of the mirror would be thrown forward as a parallel beam. The consequence of this was that every word uttered in the pulpit could be distinctly heard throughout the church; indeed, the speaker was more distinctly heard at the far end than at the intermediate portions, because this parallel beam of sound was directly cast upon those in the distant gallery. Unfortunately, however, the reflector acted in both directions. If any one whispered in that distant gallery, the sound of the whisper was gathered into the focus of the reflector. The preacher placed in that focus thus heard all the remarks that happened to be made by the people sitting in the gallery, and as it was anything but pleasant to preach and listen to criticism on the sermon at the same time, the reflector after a while had to be taken down.'

The following amusing anecdote, related by Sir John Herschel, bears additional testimony to the same truth. 'In one of the cathedrals in Sicily, the confessional was so placed that the whispers of the penitents were reflected by the curved roof, and brought to a focus at a distant part of the edifice. The focus was discovered by accident, and for some time the person who discovered it took pleasure in hearing, and in bringing his friends to hear, utterances intended for the priest alone. One day, it is said, his own wife occupied the penitential stool, and both he and his friends were thus made acquainted with secrets which were the reverse of amusing to one of the party.'

Mistakes, however, are not likely to accrue from the use of *ècheia*, since their manufacture, like that of mummies and the Cremona varnish, appears to be a lost art; and fortunately for us, the limited size of modern theatres, coupled with our progress in the study of all matters connected with sound, does not call for their aid.

NOCTURNE.

In vain, O Moon, thy pensive rise;
Thou bring'st no healing beams to me:
In vain, O Stars, ye deck the skies,
Since I no more your light may see
Twin-mirrored in two liquid eyes.

In vain, O sleepless unseen Bird,
Those warblings sweet, that long low trill;
Thou wak'st in me no answering thrill,
As once, when, blent with thine, I heard
Love-lispings that were sweeter still.

I wander through the night alone—
I wander blindly like a ghost:
From sights and sounds I loved the most
The glory and the joy are flown,
Through grief for one I loved and lost.

THROUGH 'THE WOODS' OF THE FAR WEST.

BY JESSIE M. E. SAXBY.

'THE WOODS' is the name given to that portion of the Canadian Pacific Railway which lies between Quebec Territory and the north-west prairie lands. The scenery is extremely varied, though woodlands form the chief feature throughout. Sometimes it is sublime in mountain outlines and mighty lakes; sometimes it is savage in aspect, rearing naked scaurs from depressions of swamp; frequently you emerge from a cloud of sand, over tracts of which the train has slowly dragged itself, to look on uplands as green, tender, and smiling as the dimpled lawns of England. Then, before you have done feasting your eyes upon that delicate verdure and restful beauty, the scene changes, and the cars are oscillating along crags which overhang lakes that remind one of Scottish lochs and northern seas. Here islands of fantastic form, clothed in loveliness, rise from great sheets of pellucid water; there an impetuous torrent comes rushing down a hillside; next a ravine appears holding fragments of the winter snows. Anon you hear a hissing and squelching, and you find your wheels are splashing through a marsh where tall reeds quiver, and bull-frogs continuously shriek the terrors of malaria. Next appears a streamlet meandering among homesteads; and presently the little blue beck expands into a majestic river, over some necks of which you are carried by bridges more substantial and safe than they either look or feel. Then, it may be, you pass along a level plain of rich soil, sparsely cultivated, thinly peopled, till your train—screaming, panting, full of its own importance—rushes into a bustling town, where '*After time*' is posted up on a black-board for the humiliation of your laggard engine. Yet she, poor thing, has done her best; but to drag heavy cars through sand and water, along edges of precipices, around the sharpest of corners, up the steepest of inclines, is no easy task, and may well excuse her for coming into the

station overdue. 'All aboard! All aboard! Go ahead!' and—screaming, panting as before—away rushes the land-ship along her iron road and into the solitudes of nature. And always along that line, whether it go by lake or swamp, by hill or plain, by city or farm, 'The Woods' interfuse, giving a certain sameness of character to the various landscapes which spread over thousands of miles.

Some of those forests are altogether, or in part, composed of dead trees, blasted by fire or killed by one another. Earth is so fruitful in those regions, life so eager to assert itself individually, that every little seed which finds rest within the smallest morsel of soil springs up at once and insists upon becoming a tree. In so insisting, it commits murder and suicide. Out of the mud of a stream, from the crevice of a rock, from sand wafted hither and thither by the winds, from a floating spar, from the prostrate forms of kindred, do the young trees lift their green crowns, while shoving their roots around in search of a foothold. They jostle and trample each other like human beings, and end in killing each other—very much as men do with their fellows in an overcrowded country.

The 'forest kings' who survive that fierce struggle for existence are attenuated, but grow to a great height. Their dead brethren, too, are tall. When they all began life, their supreme desire was to look upon the sun, for without him they could not flourish; so they pressed up and up, pushing ahead, in hope of rising above their fellows to behold their god; and died, striving for that end. It is a pathetic sight—those slim, straight trunks standing leafless, lifting naked arms, as if they had died in an agony of beseeching prayer, their bark stained russet and gold, crimson and ruby, by the sun, whose rays could only reach them when Death made bare and open to his light the depths of their forest primeval. Some of these poor dead creatures lie prostrate, riven and distorted as though they had 'died hard'; others of them, the kindly mosses have covered with a verdant shroud. Those who have passed through the fire to Moloch

stand very stark and red, belting groups of living trees which have escaped the conflagration, or grown up since it passed over the spot.

The contrast between the living and the dead—the one green and graceful, the other scorched and stiff—is very striking. But when the sun slides low towards the horizon, his many-coloured rays create a wonderful transformation in those woods. Living and dead trees, fallen trunks and stately stems, gnarled roots and swaying boughs, are glorified by the setting sun. All those marvellous tints which he gives to the clouds are cast upon 'The Woods,' and blend them together, as it were, in one glowing, harmonious picture of beauty. I cannot attempt to describe that which has defied the powers of many a more facile writer. I can only say that some of those sunset scenes which I witnessed while passing through that region were more gorgeous, more lovely, more like dreams of fairyland than any transformation scene depicted on the stage.

But it was not always sunset, nor always visions of natural beauty; and when one's eyes were not filled with the picturesque, the solitude, the lack of life, the absence of human beings brought depression of spirit which produced most morbid imaginings. At rare intervals we spied a solitary log-house, or a group of shanties, and near these there might be a few cattle or other 'tame' beasts. More often we saw the deserted remains of rough-and-ready habitations standing—or rather, tumbling to bits—in the centre of a 'clearing' fast returning to its primitive state. Many a charred stump on such spots told how men had come there full of vigour and hope, ready to attack nature and redeem the wilderness. Many a fair young sapling springing into exuberant life from the ashes of its martyred kin, proclaimed how the lonely pioneer had wearied and given up the unequal fight with nature.

During long hours, the train rocked on, and little was to be seen on either hand but trees—trees dead and trees living; trees felled and trees fallen; trees of all shades of green, in all stages of progress and decay. Having just come from the teeming isles of Britain, the absence of mankind was painfully impressed upon our minds in those 'Woods.' It is true the warm winds of the west are the Providence of countless butterflies and other winged beings. If your glance rests upon the waters, you will see fishes splashing and birds playing. High over the topmost boughs soar mighty eagles; and on many a branch and by many a pool the solemn-visaged heron meditates. The ferns tremble as some stealthy-footed rodent or subtle reptile glides among their fronds. Flowers bloom, little birds sing, and a sky more clear and pure and blue than we ever look up to in the north arches over all; yet, because man is not there, all seems lifeless and melancholy.

When first those 'Woods' begin to attract your notice, you exclaim about their beauty—and indeed all the time you willingly admit

that—but by-and-by you find yourself regretting that they hide some fine view afar from your point of observation. After a while you think them just a little monotonous; then you become sure they look rather dreary and impracticable; but you retract some of these thoughts when suddenly you behold them clothing a grim mountain or fringing a stagnant lake. 'How those trees improve everything—if only they were not so dense!' you ejaculate; and shortly after that you soliloquise: 'Dear me, how it stifles one to look into the depths of those woods!' Presently, you find yourself fancying they are 'no canny'; that there is something weird and fearsome in the way those trees start up as the adjunct to every landscape. Then you begin not to reflect on or speak of 'The Woods,' but you *feel* them. They grow upon your imagination, they press upon your feelings, they exercise a most strange fascination over you. An awe-stricken sensation takes hold upon you, and you are spellbound by those mystical woods. They seem peopled by ghosts; indeed, the trees appear ghosts themselves, for, as the daylight fades and shadows gather among them, the motion of the train seems transferred to the trees, and they bend and dodge and waltz as if endowed with sentient life. Here a twisted root takes the semblance of a coiled snake strangling some victim; there a decaying stump having put out, as a last protest against death, some slender twigs, looks like an antlered creature couching among the ferns. Dusky savages in waving plumes and flowing robes, mammoth beasts, dryads, demons, seem there. You would fain not look, not imagine, when all this is repeated so often that it becomes vivid and real; but in spite of yourself 'The Woods' hold you in thrall. Even when darkness comes, you cannot forget them; you feel their power though they are no longer visible. They are *there*, around you, all the same, all the time, and at peep of day you gaze out of the car window to behold them as before.

I had a dream of those Canadian 'Woods' while travelling through them; and because I know that dream must come true in the fulness of time, I tell it now. My dream was of the future, and I was travelling along the Canadian Pacific Railway fifty years hence. Men had come to 'The Woods' again, but not singly to toil in solitude, as in the days when there was no Canadian Pacific Railway opening a way through unpeopled wastes. *These* men had come in large companies, and they were not the ne'er-do-wells of decent families, nor the shiftless scum of our cities, nor disappointed competitors for place in an old country. Every man of them had brought practical knowledge of the arts of civilised life with them, a little money in their pockets, boys and girls at their back to be reared able citizens of a new country; at their side women, to do the woman's work of a settlement, and in fulfilling those humble duties lifting high the banner of selfless morality. Some of these men had been agriculturists, some artisans, some gentlemen with a modest income which in

Britain was not enough to maintain them according to their rank, but which gave them the position of affluent landowners in Canada. They were of many nationalities, and could say in the language of Tennyson :

Saxon, Norman, and Dane are we,
Teuton and Celt.

Add to these a sprinkling of the black, and rather more of the red man, with select specimens of the Jew, and you have that new nation as I saw it in my dream.

With the pertinacity of Britons—for the majority were from our Isles—these colonists had set to work, learning success from the failures of those who had gone before them, and keeping always plain before their minds that the prosperity of the individual depends upon his first considering the benefit of the community at large. So, acting in unison, they had judiciously thinned 'The Woods,' and, with an eye to the future, had permitted no wanton destruction of the trees, but had made laws which restricted men from cutting down more than a certain average, and obliged them to keep up the supply of timber. Marsh and swamp had been drained; and where the rank reeds had quaked and frogs complained, golden grain now waved and happy children sported. Cliff and scur had been broken to rise in baronial mansions and lofty spires, in streets and churches. The hill-slopes were covered with homesteads; the plains had peopled villages; the shores of each lake were studded by human dwellings; its waters gay with many a lively craft, its islands decked as the abodes of Pleasure. The British instinct 'to kill' had not been acted upon further than was absolutely needful. 'Sport' was not in fashion. So birds, unmolested, kept the insects in their place; wild beasts of a harmless kind cropped the superabundant grasses as aforetime; mountain stream and quiet pool continued to be the haunts of 'sleek and speckled finners.' Fish, flesh, and fowl were only sacrificed *humanely* when required for the use of man, or to keep the balance of nature even. And still 'The Woods' were the feature of each landscape; but how transformed!

The sun in all his power and glory had never enhanced their beauty as the hand of man had done. Tall as of old, but of vast girth, of widely-spreading branches and more variety of species, these forest kings stood grand, sublime, in the face of day, symbols of the mighty nation risen among them to take its place beside the foremost nations of the earth. Under their shelter grazed the peaceful herds of a prosperous and pastoral community. Within their shadow nestled the homes of a happy people. Health and wealth grew and flourished in their groves. Man and his inspired machines woke joyous echoes amid their avenues. The spectres had fled from those Woods, for desolation and disjointed nature had given place to that order and beauty which so surely attend upon the carrying out of God's beneficent laws, and of His command, 'Go forth and replenish the earth.'

I had been dreaming; but the engine which had drawn me through 'The Woods' seemed to say like a voice of Fate, so monotonous, so fierce, so strong did it seem: 'All aboard! On she goes! It shall be! It shall be!'—and then, with

a wild war-whoop of victory, our train dashed into Winnipeg—the great Western city which is the key to the prairie-lands, and the termination of 'The Woods.'

MR ESHOLT'S YOUNG WIFE.

A STORY IN TWELVE CHAPTERS.

CHAPTER III.

AUTUMN and winter sped away and spring came round again, and found them still pursuing this quiet laborious life. Agnes had written twice to her lover after her arrival at Liverpool, giving him her new address and asking for a few lines in reply; but month followed month without bringing any tidings to her weary aching heart. She began to be frightened, fearing lest he had fallen a victim to the terrible African climate, or that some accident had befallen him; but then, as her aunt suggested, it was by no means unlikely that her letters had never reached him, in which case it would be vain to expect an answer, as he would be unaware they had left Ecclesfield, and would naturally address his letters to the vicarage as heretofore.

As spring advanced, Agnes's cheeks flushed oftener and her eyes grew brighter, for Wilmot himself might soon be looked for, and then everything would be explained. By-and-by, the two ladies went down to Willis and Brant's office to inquire when the *Sarah Draper* was expected home, and obtained permission to leave a note addressed to Mr Burrell, to be given to him immediately after landing. The *Sarah Draper* duly went into dock, as they saw by the newspaper, but still no Wilmot made his appearance. Agnes sat stitching the day through, leaving her aunt for the most part to attend to the scholars, her colour coming and going at every knock, till daylight faded and vanished and with it all her hopes till the morrow. This went on for about a fortnight, till Miss Maria could no longer bear to sit inactive and see her dear child suffering in silence. Some certain knowledge either one way or the other must be obtained, so one afternoon she went down to the office, unknown to Agnes, and inquired whether the note left for the young supercargo had been given to him, and also whether he was still in Liverpool. She was assured that the note in question had been duly handed to him, and was further told that having obtained a few weeks' leave of absence, he had set off for London within a couple of days after his ship had been cleared. She began to comprehend now how the matter stood, and with a grieved and bitter heart, she went back home and told Agnes the result of her errand.

'Put him out of your heart, dear,' said Miss Maria, her eyes smarting with indignant tears. 'He is unworthy of your love. He scorns us because we are poor. You are no longer an heiress, and have consequently lost all attraction in his eyes. Don't take on so, child, but try to be thankful that you have escaped becoming his wife!'

Vain words to a stricken heart, which in those first moments of its agony could only feel and comprehend one thing—that it was deserted! To Miss Maria, too, the shock was a grievous one. She had dearly loved the handsome laughing

boy, and the thought of his treachery cost her more secret tears than anything except her brother's death had ever done in her life before.

But after that first bitter outburst, when heart and brain seemed stricken alike, the girl never complained, but locked up her feelings in the deepest recesses of her being. She grew paler and spoke less and worked harder, if it were possible, than before.

That summer was a very hot one. The rooms in Tydd Street were close and stifling the day through, and but little better after nightfall, bearing, as they did, the full brunt of the afternoon sun. There was much sickness in the neighbourhood, and the number of scholars fell off to about one half of what they had been in winter. Miss Maria's face, thin and anxious-looking at the best of times, seemed to grow thinner and more anxious every day. She would often implore Agnes to lay aside her needle for a few hours and go down to the pier head, where there was nearly always a fresh breeze from the river. But Agnes would reply that she didn't want to go out, and always felt better when hard at work, which was probably the truth, seeing that when busily employed she had less time to brood over her loss. But one stifling afternoon she was fairly obliged to give in, and lie down on the hard horse-hair sofa, but with a soft cushion under her head, placed there by her aunt's solicitous fingers. She became worse during the night, and next morning was unable to rise. Miss Maria sent for a doctor in hot haste. He came and prescribed, but would venture on no opinion till he should have seen more of the case. On the third day he pronounced her illness to be a bad kind of low fever. The few scholars left were at once sent home, and all work on hand, finished and unfinished, sent back to the warehouse.

The fever ran its course. For several days Agnes wandered in her mind, and scarcely ever seemed conscious of where she was or of what had befallen her. Had it not been for kind-hearted Mrs Strake, poor Aunt Maria must have worn herself out, but the worthy landlady insisted on taking turns with her in nursing. In the poor lodging-house keeper, for all her unrefined ways and innumerable solecisms of speech and manner, she recognised a true-hearted woman, and as such she did not fail to hold her in respect.

At length the fever reached its crisis, and after a struggle, youth and a good constitution prevailed, and Agnes began slowly to mend. She would require great care and attention for a long time to come, the doctor said; meanwhile, nothing must be lacking in the way of jellies and wine and other sustaining articles of diet. Miss Maria heard his words with dismay, for her little stock of ready-money was all but exhausted, and quarter-day—which, when it came, would only bring her one-fourth of her annuity of twenty pounds, nearly the whole of which would be due to Mrs Strake—was still five weeks away. The twenty-five pounds she had brought with her from Ecclesfield had vanished piecemeal long ago; indeed, soon after the beginning of her niece's illness she had found herself so short of money that one day she had rushed out of the house in a wild flurry of spirits and had sold her watch. It was an old-fashioned affair, and had been in constant use for thirty

years, and when disposed of for about half of what it was really worth, did not do much towards enriching Miss Maria. It had been her father's present to her when a girl, and it was sad, very sad, to have to part from it after all those years.

But the money thus obtained was all gone by now, and once more the everlasting problem of the poor stared her in the face. Agnes must, of course, have everything the doctor said she needed, but how obtain them? Miss Maria sat for a long time, her brow puckered with thought; at length she sighed, and then a gentle smile irradiated her face. 'Dear Marcus!' she said softly to herself. 'He would help me, of course, if he only knew; but not till everything else has been tried and has failed can I bear to tell him how we are circumstanced. But better that than allow my child to want for anything. Perhaps Mrs Strake might be able to suggest something; but it is hard to have to lay bare one's necessities even to her.'

Mrs Strake, when the state of affairs was laid before her, proved at once equal to the occasion. This was one of those cases which appealed direct to her experience and needed no after dubitation.

'You must pop,' she said with an emphatic nod. She was standing before Miss Maria with her arms folded in her apron after a favourite fashion of hers.

'Pop!' answered Miss Maria feebly, as though ashamed of her ignorance.

'What I mean is that you must pawn.' Then seeing Miss Maria's jaw drop, as though some one had just told her something which shocked her exceedingly, she hastened to say: 'Here's Miss Agnes and you between you have a lot of silk and satin dresses, more than you'll wear out in six years, so little as you go out, letting alone their getting old-fashioned. As they're no use to you just now, why not put 'em in pawn, one at a time, and raise a bit of money that way, till things take a turn? And if you can't afford to get 'em out at the end of the year, you can pay the interest, you know, and they'll be as safe there as if they was locked up in your own drawers.' Then seeing a startled look still in Miss Maria's eyes, she went on with a bitter laugh: 'Lor bless you, Miss G., it's nothing when a body gets used to it! How us poor folk would get on without the popshop is more than I know. Often and often I shouldn't be able to make up my rent if I hadn't it to fly to.'

'Thank you, Mrs Strake, very much for your kindness. I will think over what you have told me.'

She did think it over, and the more she thought the more evident it seemed to her that in no other way would the much needed ready-money find its way into her pocket. Her soul shrank within her at the thought of having to do that which to Mrs Strake seemed so much a matter of course. Would it not be a degradation, she asked herself, if she, a gentlewoman born and bred, were to resort to such a means of raising money? Then she told herself that there could be no real degradation in doing that which was both lawful and honest, howsoever much Society, with its artificial distinctions, might choose to assume that there

was as regards that particular mode of 'raising the wind' which Miss Maria was just then debating so earnestly in her mind. Had she known more of the world, she would have been aware that many of those who flaunt themselves and their belongings most persistently in the eyes of their fellows are glad at times to claim the kind offices of 'mine uncle,' and deem it no degradation so to do—so long as they are not found out.

At length Miss Maria admitted to herself with an inward groan that no other alternative was left her. So, late that afternoon, she went to her chest of drawers and with trembling fingers took out of it her black silk gown, which was trimmed with some valuable old lace, and having carefully folded it and made a neat parcel of it, and having tied a veil over her bonnet, she stole out of the house, feeling as though she were about to commit some terrible crime.

She was not so uninformed as not to be aware that the peculiar sign of a pawnbroker's establishment is three golden balls. She walked on for some time till she had got clear of her own neighbourhood, and then she began to look out for one of the signs in question. Such things are not hard to find in any large town so long as one confines one's search to the poorer quarters. Miss Maria's heart began to beat painfully as soon as she beheld three balls in the distance glistening in the last rays of the setting sun. Fortunately for her, there were not many people about; but her courage failed her as she drew near, and she walked past the place for some distance and then back again, but was still too timorous to venture inside. A sense of criminality was still strong upon her. She, the daughter of one clergyman and the sister of another, to enter a pawnshop!

So the poor gentlewoman walked backwards and forwards for nearly an hour, arguing and reasoning with herself, stigmatising herself as a coward for not daring to do that which she had come to do, and calling to mind the poor girl at home, pining for lack of proper nourishment; but still, reason as she might, whenever she approached near enough to peep into the long narrow passage, out of which sundry doors opened, as they might be the doors of so many cells, and when she noted the class of people, women for the most part, who kept flitting in and out, she turned sick at heart and was seized with a strange trembling which did not leave her till she was once more beyond the influence of the place. At length a man came out and put up the shutters one by one; still she had not the courage to go in. Then he shut and bolted the door, and next moment all was in darkness. Her opportunity for that night was over. She crept back home jaded in body and crushed in spirit.

As she entered the house she encountered Mrs Strake in the passage. The latter glanced at her bundle and then at her, and showed by her face that she understood how matters had gone. 'I could not do it—indeed, I could not,' said Miss Maria in feeble protest.

'Leave it to me, Miss G.,' said the landlady, taking the bundle gently from her. 'I'll manage it for you in the morning. I ought to have had more sense than to think of letting you go to such a place. Why, you'd be no better than a baby in their hands; they'd do just as they liked with you.'

In the course of next forenoon Mrs Strake presented herself before Miss Granby. Putting two sovereigns and a half into the latter's hand, she said: 'There! That's all they'd give on it. Bootiful material, you know, but a bit old-fashioned, and that makes a lot of difference.' Then handing her a small square piece of pasteboard, partly printed and partly filled up with certain cabalistic characters, she added: 'And here's the ticket, of which you must please take great care. I'll take a penny from you for it, if you don't mind, which is what they charges.'

Miss Maria gazed first at the money and then at the ticket. 'You good, kind creature!' she exclaimed through her tears. 'How can I ever repay you?'

So, after all, the sick girl had her wine and jelly and grapes, in accordance with the doctor's prescription.

Shortly after this episode, Miss Maria, having some trifling purchases to make, walked down town as far as Church Street with the view of obtaining what she wanted. On her way back she extended her walk a little and went round by St George's Hall. As she drew near, she saw a crowd of people streaming out of one of the doors. There had been a fashionable concert there that afternoon, which apparently was just over. As she was making her way slowly through the crush, the sound of a once familiar voice struck on her ear. She started and turned, feeling herself grow white and cold as she did so. Next moment her eyes fell on Wilmot Burrell. He was talking and laughing in the old gay insouciant style which she remembered so well, with two ladies, whom he was evidently escorting from the concert. Both the ladies were young, both were good-looking, and both fashionably dressed. His eyes seemed as if they could not travel beyond one or the other of them, and never turned the way of Miss Maria. She stood rooted to the spot till the three were lost among the crowd, and then went sadly on her way. Should she tell her niece what she had seen? she asked herself again and again. At length she decided not to do so at present—not till Agnes should be stronger and better able to bear the revelation.

But Agnes's strength came back very slowly, all but imperceptibly indeed, as it seemed to the loving eyes anxiously watching her day after day. She seemed to have no wish of her own in the matter, to have no longer any interest in living. All her old gaiety and sweet rosy happiness had vanished, as if such things had never been, leaving nothing but a pale silent shadow behind, who sat brooding the day through over the ashes of her dead love. Then one day the doctor, who did not seem at all satisfied with the progress his patient was making, said it was imperative that she should have change of air and scene. She must go to New Brighton for a month or six weeks. Very easy talking, but where were the means for carrying out such a mandate to come from? How, indeed, was the doctor himself to be paid, when the time should arrive for a settlement of his account? Everything of value had by this time gone the way of the silk dress, and when the doctor gave utterance to his fiat, Miss Maria had just changed her last sovereign. Still, his will was law.

'I must do it,' she said to herself with a little

fluttering sigh. 'No other course is now open to me. I will write to Marcus by to-night's post. I know that he has a little sum put away towards furnishing. I must ask him for a loan of ten pounds. He would send me every penny he has in the world if I were to ask him for it. Ah, how good he is!'

Although no mention has hitherto been made of the fact, Miss Maria was engaged to the Rev. Marcus Ludford, a former curate of her brother, and had been so engaged for the last seven or eight years. Though the Rev. Marcus was now verging on his fiftieth year, promotion seemed still as far from him as when he started on his career a quarter of a century before. He was a good man, worthy in every respect to be Miss Maria's husband; but it was no wonder that to him the way seemed long and dreary, and that he often asked himself whether the time would ever come when he should be able to marry the woman who had waited for him so long and patiently.

After tea, Miss Maria sat down and wrote her letter without saying a word to Agnes about it. Just as she was folding it up, there came a tap at the door, which, next moment, was opened, displaying to view a stout, middle-aged, apple-cheeked woman, with a face that was the picture of good-temper and content.

'Gracious me!' exclaimed Miss Granby, as she started to her feet, 'can that be Peggy Myers?'

'It's me, Miss Maria—there's no mistake about that,' answered Peggy with a broad smile.

'Come in, do, and shut the door. There's always a draught in that passage.—Well, Peggy, I am glad to see you. Rather a different place this from the vicarage,' she added with a little tremor of the voice and a faint blush, as she shook the newcomer's hand heartily.

'It is indeed, Miss Maria, and sorry I am to see you in such a place. I heard that master was dead, and that you had come to live in Liverpool, and I've been trying for months to find you out, but it was quite by accident I heard of you at last.—But, dear heart alive, how pale and thin Miss Agnes do look! She must have been very ill sure-ly.'

Peggy had been cook years before at the vicarage, but had left it to get married. She stayed upwards of an hour that evening; and her talk about old times and old places enlivened Agnes so much, and seemed to do her so much good, that Miss Maria made Peggy promise that she would pay them another visit before long. Now, Peggy was a shrewd woman in her way. Her curiosity was not satisfied with the scraps of information Miss Maria had vouchsafed her, so, after leaving the house by way of the front door, she went down the area steps to the basement kitchen in search of Mrs Strake, and as that lady was only too glad to have some one to talk to who had known her lodgers in better days, Peggy soon contrived to find out all she wanted to know. The information thus acquired she revolved in her mind as she walked home.

'I'll go to Mr Esholt to-morrow morning as sure as my name's what it is, and tell him all about the poor dear ladies,' she said to herself. 'I mind me well when the other Mr Esholt, who's now dead and gone, used to come, years ago, to the vicarage, and how he and master used

to be more like brothers than friends, calling each other Ned and Dick, just as if they were two great boys together. Yes, I'll make bold to go down to the office and ask for Mr Esholt, and tell him all I've learned about Miss Maria and Miss Agnes. For his brother's sake, if for nothing else, he'll never let them starve for the want of a few pounds—and he such a good kind gentleman as he is!'

Peggy Myers's husband held the position of foreman-packer in Mr Esholt's warehouse.

(To be continued.)

A FOURTEENTH-CENTURY ARMADA.

THE tercentenary of the defeat of the Spanish Armada has been duly celebrated at Plymouth, and a monument is to be erected on the Hoe to commemorate the failure of Philip of Spain's great enterprise against the religion and the liberties of England. We have most of us been refreshing our memories by reading once more the story of our great national deliverance, and some of us have perhaps recalled the fact that once only since 1588 have our shores been seriously threatened with invasion. Napoleon emulated Philip: a vast flotilla had been collected at Boulogne; Nelson had been lured away to the West Indies, and the Channel was for the moment clear for the French transports to cross. But then, as before, the winds and the waves befriended the seagirt land, and while Bonaparte was waiting for a favourable breeze, the opportunity passed never to return.

The stories of these two futile attempts to violate our shores are well known; but few save students of history know anything of the projected invasion of England by Charles VI. of France, just two hundred years before the Armada set sail; and yet the French Armada of 1386 was very near being successful, and was in its way as great and as serious an attempt as that of King Philip. It is true that had Charles succeeded in landing his troops, the invasion would have hardly been more than an episode in the great hundred years' struggle between England and France; Agincourt would perhaps have been fought on English soil; and our ancestors would have been able to put into practice the tactics which Charles the Wise had used against them. It was not a question of national life or death, as in the days of Philip and of Napoleon; neither religion nor freedom was at stake; yet the crisis was a serious one, and so all contemporary writers regarded it, if only because the success of Charles would prove that it was possible to invade England, and would destroy the halo of inviolability which encircled the island.

In the early years of Richard II.'s reign the country was in poor heart. The king had belied the promise of his parentage, and surrounded himself with advisers whom it was possible for his intriguing uncles to stigmatise as favourites. Parliament was chary of granting supplies; trade had declined; the great captains of the previous reign were dead, and the French had more than once insulted the English coast, and had even sailed up the Thames and burnt Gravesend; the Channel

swarmed with pirates; and the people, since the suppression of the peasant revolt, were at the mercy of the nobles. The opportunity seemed favourable to Charles VI., flushed with his victory over the rebellious Flemings at Roosebeke, and it is little wonder that 'the lords and the most part of the chivalry of France said, why should not we for once go to England to see the country and the people, and to learn the way thither, as they have learned it to France?' Moreover, it was imagined that John of Gaunt had taken with him the flower of English fighting-men to aid him in his wild attempt to gain the crown of Castile, and that England was well-nigh defenceless. The old plan of getting the Scotch to attack England had been tried, and had failed, with the only result that the relations between Scotland and France became highly strained, and the knights and esquires who had gone with John de Vienne to Scotland returned 'right poor and feeble,' having been pillaged by their allies, 'and cursing the day that they ever came to Scotland, wishing that the French king had peace with England one year or two, and so both kings together might go into Scotland, utterly to destroy that realm for ever; for they said they never saw so evil people, nor so false traitors, nor more foolish people in feats of war.'

The prospect of turning the tables upon the English, who had wrought so much evil to France, was so popular, that people readily paid 'such taxes and tallages as had not been imposed for a hundred years before,' and many gave more than was demanded of them. A large part of this money was laid out in the purchase of ships to keep the Channel clear and transport the invading army to England. 'From Spain,' says Froissart, 'and the port of Seville to Prussia there was no great ship on the sea that the French could lay their hands on but was retained for the king of France and his people. I trow that, since God created the world, there never were seen so many great ships together as were that year at Sluys and at Blankenburgh; for in the month of September there were numbered twelve hundred and eighty-seven ships at Sluys; their masts seemed in the sea like a great forest.' There were ships enough, it was said, to form a bridge across the Channel, along which the men-at-arms might walk. Besides this, vast quantities of stores and provisions were collected—'hay in trusses, garlic, onions, beans, cheese-bowls, barley, oats, rye, wheat, wax candles, boots, shoes, helmets, spurs, hooks, boxes of ointment, bottles of verjuice and vinegar, vases, fat pigs, kitchen and buttery utensils, and every article necessary for man and beast.'

Clisson, the Constable of France, who had acquired great influence over the weak and unstable Charles, had a great ship building in Brittany. He had also constructed a framework of timber like a town, with walls and bastions and battlements, which was to be taken over to England and set up there, 'for the lords to retreat to as a place of safety, and to keep off any danger that might arise from night attacks.' It was said to be twenty feet in height and three thousand paces long; while at every twelve paces there was a tower large enough to contain ten men, and ten feet higher than the rest. It was made to take to pieces; and many carpenters and other

workmen were engaged at very high wages to take it properly down and put it together, which could be done in about three hours.

Adventurers of all nationalities flocked to Sluys to join the expedition. Sluys, it may be remarked in passing, is a town of the Netherlands, on the Belgian frontier, and in the fourteenth and fifteenth centuries was a prosperous port. To Sluys, then, these adventurers came trooping 'out of Savoy, Germany, and from the going down of the sun to the lands of the Count of Armagnac'—the majority of them for the mere love of fighting and in hopes of sharing in the plunder; for England was supposed to be the richest country in Europe, and the French had made up their minds that the English would be ruined and destroyed beyond resource, the men put to death, and the women and children carried into slavery. Altogether, there were sixty thousand men ready to set sail, and eagerly waiting for the completion of the preparations. 'The great nobles of France,' Froissart tells us, 'sent their servants to Sluys to get all things ready for them. Each lord strove to have his ship the best supplied, and the most ornamented with painting and gilding, with their coats of arms emblazoned on them and on the flags. Painters had a good time, for they were paid whatever they asked. It was told me that Sir Guy de la Tremouille expended upwards of two thousand francs in painting and ornamenting his ship.'

In England, the first idea was that these preparations were intended against Calais, which was at that time in our hands; but when it became evident that an invasion was seriously threatened, a complete panic set in. 'The Londoners,' says Walsingham, 'timid as hares, tried to discover hiding-places if their city was taken, having no confidence in their powers of resistance; and those who in times of peace had boasted that they would blow every Frenchman out of England, now thought England was lost, and, like drunken men, rushed to the walls and destroyed and threw down all the adjacent houses; in fact, they were so overcome by fear that they behaved like men in the direst necessity.' As usual, there were plenty of people ready to increase the panic by false and exaggerated reports. It was currently believed, according to Knighton, that Clisson's palisade was as big as London, and measured seven leagues in circumference. Nor was the alarm confined to the ignorant; for Sir Simon Burley, one of the royal ministers, seriously advised the Abbot of Canterbury to remove the relics of Becket, lest they should fall into the hands of the French. The king's uncles, the Earls of Buckingham and Cambridge, could think of nothing better than recalling John of Gaunt from Castile to defend England; but fortunately, there were wiser and cooler heads.

The king was summoned back from Wales; and on his arrival, a great Council of nobles, prelates, and knights was held to devise measures for repelling the invasion. The Earl of Salisbury took the lead, and in a manly and patriotic speech showed the necessity of union in the face of the great national danger. Prompt measures were taken. It being still doubtful whether Calais were not after all the real object of attack, Harry Percy, already known as Hotspur, was sent thither with reinforcements of men and pro-

visions; a truce was made with Scotland; the whole nation was summoned to arms, and diligent preparations were made for guarding the coast; 'though,' says Froissart, 'there were more than a hundred thousand who desired nothing better than the arrival of the French. "Let them come," said these light-hearted companions—"let these Frenchmen come, and not a limb of them shall return to France." Such persons as were in debt, and had no thought or means of payment, rejoiced at the intended invasion, and when pressed by their creditors would say: "Be easy; they are coining new florins in France wherewith you shall be paid." On the strength of this, they lived and spent largely, credit not being refused them; for if there were any demur, they used to say: "What would you? Is it not better that we should spend freely the goods of this land, than that they should be kept for the French to find and take?"

'The great nobles and the townsfolk, who had much to lose, appreciated the danger, and were in great doubt; but the commons and poor companions cared nought, nor did the poor knights and esquires, but they wished for the invasion either to win or to lose all. "God," said they, "hath sent a good time to us, since the king of France is coming here. What a valiant and enterprising king he is! There has not been for three hundred years a king in France of such courage. He will make his people good soldiers, and they will make him a powerful king. Blessings on him who is now coming to see us, for now shall we all be either rich or dead."

Meanwhile, the Council had completed their arrangements for protecting the coast. The Earl of Salisbury undertook the defence of the Isle of Wight, where his property lay; the Earl of Devonshire was sent to Southampton with six hundred archers and two hundred men-at-arms; the Earl of Northampton to Rye; the Earl of Cambridge to Dover; the Earl of Buckingham to Sandwich; the Earls of Pembroke and Stafford to Orwell; Sir Henry and Sir Faulx Percy to Yarmouth; and Sir Simon Burley was appointed governor of Dover Castle. Every port and harbour from the Humber to Land's End was well provided with archers and men-at-arms; and it was reckoned that there were in England a hundred thousand of the former and ten thousand of the latter. Rochester Bridge was broken down at the demand of the Londoners. On all the hills along the sea-coast watchmen were posted. The manner of posting these watchmen was, according to Froissart, as follows: 'They had large Gascony casks filled with sand, which they placed one on the other, rising like columns; on these were planks, where the watchmen remained night and day on the lookout; and their orders were, the moment they should observe the French fleet nearing the land, to light torches and make great fires to alarm the country; and the forces within sight of these fires were to hasten to the spot. It had been resolved to allow the king of France to land, and even to remain unmolested for three or four days: they intended first to attack and destroy the fleet and all the stores; and then to advance to the king, not to combat him immediately, but to harass his army, so that it might be disabled and afraid to forage. The corn-lands were all to be burnt—and England at

best is a difficult foraging country—so that the French would soon be starved and destroyed.'

All the while the French were continuing their preparations; and the middle of August 1386 was fixed upon as the time for the invasion to take place. The king heard a solemn mass at Notre-Dame, took leave of Queen Blanche, and went to Noyon, and thence, through Amiens, to Lille, taking the Duke of Bourbon with him. It was slow work travelling in those days, and it was not till the middle of September that he met the Duke of Burgundy at Arras. Gradually the seigneurs and their men-at-arms came up. The greatest care was taken in the selection of the troops; only picked men were to be embarked; and the Constable gave orders that for every two or three knights there should only be allowed one reserve horse and one 'varlet.' Still the departure was delayed while they waited for the arrival of the Duke of Berry, who was 'still loitering, having no great desire to go to England;' but the men comforted themselves by saying: 'The king will embark on Saturday, on Tuesday, or on Thursday;' and every day of the week they said: 'He will embark to-morrow, or the day after.'

While the French were thus waiting for the arrival of the Duke of Berry, a curious episode occurred. Leon, king of Armenia, a member of the House of Lusignan, who had been driven from his kingdom by the Turks, and, after various strange adventures, had settled down in France, took upon himself to mediate between the rival kings. Of his own accord he came over to England and requested an interview with Richard. He was courteously received at Dover, and granted a safe-conduct to London, where he was well regarded, because he was a stranger, and good cheer made for him. On coming before Richard, he explained the object of his mission, expressing his anxiety to make peace between England and France, 'for this war between them is not very becoming; its long continuance has greatly emboldened and raised the pride of the Turks and Saracens. No one now makes any opposition to them, and this is the reason that I have lost my crown and kingdom.'

Richard postponed giving any answer until he had assembled his Council; and four days afterwards the king of Armenia appeared at Westminster and laid his proposals before the royal Council. He was treated with all courtesy; but it was impossible to treat with a mediator who had no authority to speak on behalf of France, and Archbishop Courtenay, as spokesman of the Council, replied briefly and wisely: 'Sir king of Armenia, it is not the custom, nor has it ever been, that in such weighty matters as those now in dispute between the king of England and the king of France, that proposals of peace should be made to the king of England while an army is ready to invade his country. Our opinion is that you should return to the French army and prevail on them to retire; and when we are fully assured that they have done so, do you return hither, and we will willingly attend to any treaty you shall propose.'

So the king of Armenia returned; but it is clear that he had made a favourable impression on Richard, for a pension of a thousand pounds was granted him, and great gifts were offered

him, none of which would he accept save a ring of the value of a hundred francs. On his return to France he told Charles of the reception of his peaceful overtures by the English Council; 'but the king and his lords paid no heed, and sent him away, for they were resolved to sail for England at the first fair wind after the arrival of the Constable and the Duke of Berry.'

Clisson soon came up from Tréguier, but not without having sustained great damage on the way. He had seventy-two ships, some of them laden with the famous wooden wall; but when they were off Margate, a gale dispersed them; seven were driven to Zeeland and captured; others were taken by English cruisers; and four of the ships that fell into English hands contained portions of the wall. They were brought to London; 'the king and all the Londoners had great joy of them;' and the *ville de bois* was set up as a defence round the town of Winchelsea. The autumn was now far advanced, and it became a question with the French whether it was worth while to wait any longer for the Duke of Berry. News came that he had left Paris, and urgent messages were sent to him to hasten his troops; but still he lingered. At length, on the eve of All-Saints, the wind being very favourable, it was decided to set sail, and the Armada left Sluys. But it had not gone twenty miles before the wind again veered round, and they were driven back with such force that many of the ships were shattered. 'Thus always the time passed, and the winter was approaching, and the lords lay there in great cold and peril.' The Flemings, too, were very anxious for them to be gone, and quarrels broke out between them and the French. It was the end of November before the Duke of Berry arrived, and the wind was then most adverse, so that it was clear that the expedition must be postponed. Charles VI., deeply conscious of the humiliation of abandoning an adventure which had been so loudly vaunted, cried out: 'In God's name, if no one else go, yet will I.' The lords applauded his bravery; but decided that the invasion should be deferred till April or May, and that such stores as were not perishable should be reserved till then. The troops were disbanded; and the Counts of Armagnac and Savoy and the Dauphin of Auvergne, who had spent ten thousand francs on the expedition, returned sulkily home. In England, the news was received with mixed feelings: those who had expected to make themselves rich by the spoils of the French were chagrined; but most people rejoiced at having so easily escaped such a great peril. A grand feast was given in the city of London to those who had been appointed to guard the different harbours, and the king kept Christmas magnificently at Westminster.

Next spring, the Earl of Arundel fitted out a fleet, with which he captured nearly a hundred French and Flemish ships, and took booty which Froissart estimates at two hundred thousand francs. After this, the invasion of England was impossible, and though some show was made of preparations at Tréguier and Harfleur, the opportunity was past. A desultory naval war ensued, in which the English under Arundel, the first of our great admirals, had decidedly the better of it; and it was not until the reign of Henry

IV. that the French seriously thought of attacking our shores.

What the result of an invasion in 1386 would have been, it is impossible to say. Had Richard shown the same courage and presence of mind that he did in Wat Tyler's insurrection, he might have become a national hero, and saved both his crown and his life. As it was, security from invasion let loose all the factiousness of the nobles; and the remainder of his reign was little more than a struggle for ascendancy between rival parties, none of which seems to have been animated by the least patriotism or honesty of purpose. In this dreary reign the one bright spot is the episode of the French Armada, which for a moment silenced the strife of factions and united England against a common foe.

WHO DID IT?

A STORY IN FOUR CHAPTERS.

CHAPTER IV.—CONCLUSION.

THE events of the past few days had changed Dick Ottery from a careless, free-and-easy, pleasure-loving boy of five-and-twenty into a man. His legal training came to his aid at a crisis when it was most needed, and so quietly did he slip off to London and to Scotland Yard, and obtain the warrant for Claude Shute's arrest, and see the detectives start on their journey duly provided with photographs of their man, that not a soul outside the walls of Colyton Hall had any idea that Claude Shute was even suspected of being concerned in the murder of old Jethro Seaton. All this, however, might have leaked out through the loquacity of the telegraph clerk who had taken in Mary's message, had not the girl recovered her presence of mind quickly enough to run back for her change, and to impress secrecy on the man; and a favour asked by Miss Ottery was never refused. Little by little, however, Colyton became aware that something unusual was being enacted in its midst, with the nature of which it was not so fully acquainted as a good old-fashioned gossiping village had a right to expect.

The landlord of the *George* had been ordered by Mr Richard Ottery to have a fly ready to meet a certain night-train from London; and as the *George* fly was only requisitioned upon very special occasions, this alone was food for conjecture. Again, there was a mysterious importance about the two constables who represented the local police force, which being suddenly assumed, was unaccountable; and over their beer in the parlour of the inn they whispered and nodded and exchanged significant glances, which sufficiently proclaimed their engagement upon some 'job.' Finally, the group of curious ones who were awaiting the arrival of the particular London train for which the fly was ordered, saw Mr Claude Shute accompanied by a tall stranger, get into the vehicle, and followed it to the police station, where it was received by the constables in full uniform, and by Mr Richard Ottery.

Immediately, the bar of the *George*, which had begun to empty for the night, filled, and the conclusion arrived at, after a vast consumption of ale and tobacco and much expenditure of breath, was that 'the queer chap with the specs,' as Claude

Shute was called, had been arrested for the murder of Squire Seaton.

During this interval of four days which had elapsed between Dick's expedition to Scotland Yard and the arrival of Claude Shute at Colyton, Mary had let herself sink almost into a state of prostration. On the night of the arrival of Claude in custody, Dick came into the study where Mary was lying tortured with a racking headache, and said: 'Our gentleman has arrived.'

'Do you mean that Claude Shute is in Colyton?' exclaimed the girl, starting up.

'Yes; that he's safe in the lock-up, awaiting the next petty sessions at Shinglemouth,' replied Dick.

'Arrested—in the lock-up—here! Richard, is it true?'

'Of course it is. Why, you don't think Scotland Yard would let such a prize slip?'

'Was he arrested at Brussels?'

'Yes; calmly smoking in the courtyard of the hotel, like any honest peaceable tourist.'

Mary pressed her hands to her bursting forehead. Had he never received the telegram? Had the clerk never sent it? Could Dick have intercepted it? Why had he walked to meet his fate? What did it mean—except, joyous thought, that he was really innocent, and was prepared to face inquiry? 'Coolest Johnnie I ever saw,' continued Dick. 'When he saw me, he actually said: "I suppose I have to thank you for this, Mr Ottery?" Actually had the cheek to ask me to tell him all about it, as if he had never heard of it; answered the questions at the police station as if he was in a drawing-room.—But that sort of bluff won't do, and he'll find that out when he's hauled up before Judge Nooser at Mixeter.'

'Can I see him?' asked Mary.

'I don't know.—What do you want to see him for? At anyrate you can't see him to-night. Bless you, he's asleep and snoring now. These fellows always sleep and eat as well when they're in their cells as at their homes.'

'Cold! Cruel! Heartless!' exclaimed Mary bitterly. 'I could never have believed it of you!'

'Any more than I can believe that infatuation for a man can make a woman blind to any crimes he likes to commit, and forget justice to her own flesh and blood,' retorted her brother.

By the next morning the news of Claude Shute's arrest was generally known in the village, and from the village was being spread to the country around as rapidly as eager tongues could perform their functions. There was not much expression of feeling about the matter, for old Jethro Seaton had never mixed sufficiently with the people or spent enough money amongst them to be popular; and, as has been already said, Claude Shute was, on account of his reserved mysterious habits, regarded somewhat askance. One woman, however, did energetically defend the prisoner, and this was his landlady, Mrs Dawes, who declared that she knew him as well as did Miss Mary herself, and that he was utterly incapable of committing such a crime as that with which he was charged.

At an early hour, Mary hurried down to the police station, around which a gaping, whispering crowd was already gathered, and was permitted to speak with Claude through the grating of his cell

door. She saw that he was pale and anxious-looking, and, perhaps naturally, construed these appearances as signs of guilt. 'Claude,' she said, 'why are you here? Did you not get my telegram?'

'Of course I did, my darling,' he replied; 'and I couldn't for the life of me understand it, as I had heard nothing of your uncle's death.—But why was I to fly? I had committed no crime.'

'Really—truly—are you innocent?' Mary asked eagerly.

'Why, of course, Mary. Surely you of all people could not have believed me guilty?'

'I don't know—I don't know,' sobbed the girl. 'Appearances were so terribly against you.'

'I am sorry you could not believe in me—very sorry. But tell me all about it from beginning to end. I asked your brother last night; but he laughed and said he could tell me nothing new.'

So Mary related to him all with which we are familiar.

'I know the summer-house well,' said Claude, when she had finished. 'Many a long hour have I sat talking and discussing with your poor old uncle.—And so you think that I could have gone down there, committed the crime, and got back to my rooms in five minutes, do they?—I was with you at two you remember, Mary.'

'And poor uncle's broken watch had stopped at a quarter past,' said Mary.

'At which time I was packing up to go away, for I remember Mrs Dawes saying that it was ten minutes past two as I came in, and that I should never have time to catch the three o'clock train.—Look here, my own Mary. As you say, appearances are against me, and I must have help. I have only one friend in the world besides you and Mrs Dawes, and that's Dr Waller. Would you mind asking him to come round here as soon as he can?—Well! I never would have believed that your brother's hatred to me was so great that he could do a thing like this.'

'But appearances are against you, Claude.'

'So they are, Mary—so they are, and we must do our best to clear them.'

Mary went away, and soon returned with the worthy little doctor. To him Claude confided all that concerned himself, and requested him to use his influence to allow him, Claude, to visit the scene of the tragedy.

Accordingly, with a constable at one side, and Mary and the doctor on the other, Claude passed through the crowd towards the Hall. On their road they met Dick, who looked surprised at the unusual procession of a prisoner under arrest with his friends outside the station walls.

'You had better come with us, Mr Ottery,' said Claude. 'We are going to visit the scene of my crime, as you call it; perhaps, on the return journey I may be in a position to dispense with the somewhat rough attentions of the gentleman in uniform at my side.'

Upon which gentle rebuke the constable somewhat loosened the grasp which he kept on Claude's arm as a method of impressing the crowd with his importance, and muttered something about 'Heels not bein' so slippery as some prisoners as I knows on.'

Dick acquiesced silently, and for the first time asked himself if, after all perhaps, he had not been a little hasty in acting as he had.

'With your permission,' said Claude, 'we'll just ask Mrs Dawes a question or two before we proceed farther.' So they turned aside to the cottage of the old woman, who, at the apparition of the little procession, followed by the entire village, making straight for her door, was not quite sure if she were not in some way or other about to be implicated in the 'murder business,' and was accordingly in a state of tremor.

Mrs Dawes's evidence was conclusive as to the hour at which Claude Shute had arrived to pack up for his visit to the continent; and her little niece corroborated what she said. So they went on to the Hall and down to the summer-house, over which a couple of stout fellows were keeping guard against the intrusion of the curious, whose heads were already lining the wall by the pond.

'Now, then, Mr Ottery,' said Claude, 'have you found any weapon with which this murder could have been committed?'

'No,' replied Dick. 'But that counts for little, as it would have been the easiest thing in the world for the murderer to have thrown it away into the thickets.'

'Very well. How did you find Mr Seaton lying?'

Dick pointed out exactly the position in which he had first seen his uncle, and showed where his head had bled on to the floor.

'Yes,' said Claude; 'he always used to sit with the left side of his face towards the wall, so that he felt the warmth of the sun, yet was not interfered with by its glare; therefore, doctor, the blow must have been dealt from the direction of the wall?'

'Precisely,' replied the doctor.

'You were playing cricket that afternoon, Mr Ottery?' asked Claude.

Dick nodded in assent.

'Could you remember what you were actually doing at about the time when, according to the evidence of the watch, your uncle met his death?'

'Yes, I was batting. We had lunch at half-past one; we resumed the game at two; I going in to bat, and I was in three-quarters of an hour.—But what has that got to do with it?'

'Well, it may have a great deal, and it may have nothing. When I have been sitting here with your uncle, I have often seen balls come whistling over the wall: sometimes they pitched in the pond, sometimes in the wood; and one, I remember, pitched on the roof of this summer-house, and I told your uncle that he might meet with an accident. Was a ball hit over here during that day's game?'

'Yes—yes, of course there was,' stammered Dick, who had suddenly turned deathly pale.—'And what is more, now I come to think of it, it would have come exactly over here.'

'Let us see, to make sure,' said the doctor.

So the party crossed over to the wall, and Dick showed exactly where he was standing when he hit the ball to square leg about which he had spoken to Mary after the match.

'I suppose you haven't found the ball?' said Claude.

'No; there are dozens lying about the gardens which have been hit over at different times,' replied Dick; 'we never dream of trying to find them in such a difficult place.'

'Then your uncle was killed by the ball which you hit over,' said the doctor, leading the way back to the summer-house.

A murmur of satisfied conviction passed through the little party, and Mary in her anxiety clung to the arm which the constable had now thought fit to release.

'The ball should be in the summer-house,' said the doctor.

So they returned to the summer-house, and all were presently engaged in searching the rat-holes dotted about the walls and floor. Finally, Mary uttered a faint cry and handed a ball to the doctor. It was nearly new, and although the rats had already commenced operations on it, there was visible on it a deep patch, which the doctor pronounced unhesitatingly to be blood, and, moreover, demonstrated conclusively that it had been found at the most likely spot to which it would have rolled after having dealt the deathblow.

Of the scene which ensued—of Mary's joy that her lover had been absolved—of poor Dick's abject contrition for the humiliation he had brought on Claude Shute—of the congratulations of the doctor—of the professional disappointment of the constable, nothing need be said. Simply, we may conclude by saying that in due course Claude Shute made Mary Ottery his wife, and that the friendship between him and her brother has never since been clouded by the faintest shadow.

HUMOROUS TOASTS AND SENTIMENTS.

It was from a toasted bread or biscuit which early formed an addition to many English drinks that we acquired the word toast as applied to the act of drinking the health of any person; or to any idea or sentiment, as it is called. We have very early mention of toast-masters who arranged the amusements and promoted the conviviality of the company.

A humorous incident lately occurred, which shows that modern toast-masters are sometimes not behind their ancient prototypes in promoting the hilarity of the company. It happened at a political dinner at which several noble lords and well-known leaders of political thought were present. The toast-master, either from extreme nervousness or some equally potent cause, got considerably confused in the matter of the toast list, and a *faux pas* which he committed at the outset caused general amusement. In calling on the company to drink the toast of the Queen with all the honours, he proceeded to give the keynote; but instead of the familiar National Anthem, the company were astonished to hear the refrain of 'For he's a jolly good fellow' echoing from the head of the room. The unfortunate man never got beyond the first syllable of the last word when he discovered his mistake—as well he might—from the burst of hilarity that succeeded.

Something of the same kind of mistake happened at a fashionable wedding. The band, after the toast of 'The Bride,' struck up an orchestral version of the time-honoured glee, 'Trust her not—trust her not—she is fooling thee!' A wicked conspiracy between the leader of the band and the best-man was suspected.

The best toast of the season was, we think, given by a printer, namely, 'Woman—the fairest

work in all creation. The edition is large, and no man should be without a copy.'—A fond young lover in a little speech anent the fair sex referred to his sweetheart as a 'Delectable dear, so sweet that honey would blush in her presence, and treacle stand appalled.'

It may not be difficult to concoct a pretty speech, but true gallantry combined with wit is needed in making one which shall contain as much delicacy as flattery. 'You forget that I am an old woman,' said a lady in response to an admiring allusion in a neat speech from one of the old school.—'Madam,' was the reply, 'when my eyes are dazzled by a diamond, it never occurs to me to ask a mineralogist for its history.'

A celebrated statesman, when dining with a certain Duchess on her eightieth birthday, said, in proposing her health: 'May you live, my Lady Duchess, until you begin to grow ugly!'—Her ladyship's tongue was as ready as his own. 'I thank you, sir,' she replied; 'and may you long continue your taste for antiquities.'

Goldsmith, in alluding to 'the ladies' modest custom of excusing themselves in drinking toasts,' says:

Nor the coy maid, half willing to be prest,
Shall kiss the cup to pass it to the rest.

Many amusing and witty allusions in giving toasts and applying sentiments are probably thus lost by ladies 'excusing themselves,' as may be instanced by the following. Among the gifts of a newly married pair was a new broom, sent to the bride by a lady-friend, the strange present being accompanied by this quatrain: 'This trifling gift accept from me; its use I would commend: in sunshine, use the brushy part; in storms, the other end.'

The sentiments of another of the gentler sex were equally humorously and tersely conveyed when she thus expressed herself regarding matrimony: 'Get married, young men, and be quick about it. Don't wait for the millennium for the girls to become angels. You'd look well beside an angel, wouldn't you? you wretches!'

Slightly ironical with regard to the fair creatures was one of the toasts drunk at a recent celebration: 'Woman! she requires no eulogy—she speaks for herself.' This reminds us that an old bachelor at a wedding feast had the heartlessness to offer the following toast: 'Marriage—the gate through which the happy lover leaves his enchanted regions and returns to earth.'—But this was somewhat atoned for by a more gallant wedding guest, who, at the marriage of a deaf and dumb couple, wittily wished them unspeakable bliss.

To talk humorously on such occasions requires thought before speech, lest one should be considered more amusing than complimentary. To quote a case in point. A gentleman was walking down the street the other day with his friend Jackson, when they met a clergyman. The reverend gentleman, though possessed of a large brain, has but a diminutive body to support it. Quite recently he had united himself, for good or ill, to a buxom widow. The minister blushed a little as they passed. 'What is the meaning of that, Jackson?' asked his companion.—'Well, you see,' was the reply, 'we had a tea-fight at the minister's shortly after he was married. I was called upon to make a speech. You know you

are expected to be humorous on such occasions; so I referred in a casual way to the minister as the widow's mite. He has acted strangely ever since.'

A farmer was at an agricultural banquet at which a round of successful generals were being toasted. Some gave one famous name and some another. When it came to his turn to add to the list, he said: 'I'll give ye Sanders Pirgивie o' Crichtondean, for he had a sair fecht wi' the world a' his life—an honest man wi' a big family!' That was a novel if homely sentiment.

Appropriate, but not very enlivening or comforting, must have appeared the toast lately said to have been proposed at a banquet given to a writer of comedies in honour of his latest work. A waggish guest rose to his feet and said: 'The author's very good health. May he live to be as old as his jokes!'

This toast was given at a recent convivial gathering: 'The bench and the bar. If it were not for the bar, there would be little use for the bench.' As pithy and, if anything, still more to the point was the following, given at a dinner of shoemakers: 'May we have all the women in the country to shoe, and all the men to boot.'

These last expressions of sentiment must, we imagine, be after the style recommended by Charles Lamb when he gave some advice about speech-making to this effect: 'A speaker should not attempt to express too much, but should leave something to the imagination of his audience;' and he tells how, being called on to return thanks for a toast to his health, he rose, bowed to his audience, and said 'Gentlemen,' and then sat down, leaving it to their imagination to supply the rest.

THE MONTH:

SCIENCE AND ARTS.

THE meeting of the British Association at Bath, while not presenting any unusual feature, was certainly a success, and many papers read were not only of scientific but of popular interest. Indeed, we may say that the meeting was to a certain extent remarkable for the number of subjects which came before it which required no special scientific training on the part of the audience to understand them. Electric science has been so much popularised during recent years, that all relating to it was eagerly listened to; and Mr Preece, who was president of the Mechanical Section, found willing listeners to his address upon the Applications of Electricity. But the lions of the Mechanical Section were two speakers whose names are new, but who were listened to with more rapt attention than is commonly vouchsafed the most gifted orators. These were the Phonograph, and its rival the Graphophone, which, after they had made their bow before the Association, were removed to two anterooms, where streams of people visited them during the whole week.

Mr Edison's Phonograph is now well known, and we have lately pointed out how several improvements in it have removed from it the

stigma of being but a toy. Colonel Gouraud, under whose fatherly care it was presented to the British Association, explained that ordinary correspondence between himself and Mr Edison at New York had now entirely ceased. They each spoke to a Phonogram, and the sound-tracing from the instrument was sent by post across the Atlantic from one to the other; so that each of these correspondents has the great satisfaction of hearing his friend's words in the familiar voice. When this system becomes general, how eagerly shall we all look for the phonograms from absent friends! Is it too much to hope that in this novel form, letter-writing, which, in the way our forefathers understood the word, is a lost art, may be recovered, with much additional profit to us all?

The Graphophone is, like the Phonograph, of American origin, but is so like the latter instrument that they seem almost identical. In the Phonograph a cylinder of waxlike material receives and records the mechanical effects of the sound-waves; while in the Graphophone this cylinder is of paper, with a waxen surface. Mr Edison's machine, again, is driven by a small electric motor, whilst its rival is worked like a sewing-machine by a treadle. The Graphophone was invented by Mr C. S. Tainter, who claims the merit of having first introduced the waxen surface for the moving cylinder. This, it would appear from a recent telegram from Mr Edison, has been superseded in the Phonograph by a material which, while resisting all atmospheric influences, gives far better results than wax.

Electric bells are now regarded as a necessity in all well-appointed buildings, and any improvement in their arrangement or construction is therefore a matter of popular interest. Such an improvement is indicated in the magnetic system which has been designed by Messrs Cox-Walker & Swinton, and which is now being introduced commercially by the Equitable Telephone Association of London. The bell requires no battery, and is practically everlasting. The system consists of two parts, one being the generator, and the other the bell itself. The generator consists of a horseshoe magnet, between the poles of which is revolved, by means of a button easily turned by the thumb and finger, an armature, or shuttle of wire. This action arouses a current of electricity, which traverses the wire leading from the generator to the bell, and rings the latter. The principle is of course not new, but has been carried out in a manner which at once presents it in a practical form. Previous attempts in the same direction have resulted in the production of instruments which are in comparison both bulky and clumsy.

It is stated that in Norway the telegraph poles are preserved from decay in a thoroughly effectual manner by boring an inch-hole in the wood about two feet from the ground, and filling the orifice with crystals of copper sulphate (bluestone), afterwards plugging the hole with wood. The crystals gradually melt and permeate the wood, so that it turns a greenish colour. We are not aware that this plan has been tried in Britain, where it might also be adopted by farmers and others for the preservation of gate-posts and similar

structures, more especially as bluestone is already a familiar substance on the farm.

Mr Inverarity, who is an enthusiastic hunter of large game, has been reading a paper before the Bombay Natural History Society in which he discusses the habits of the tiger, and more especially the mode in which it kills and eats its prey. He tells us that the awful stroke of the forepaw, of which we have heard so much in terrible tiger stories, is a fiction. The animal clutches with its claw as does a human being with his fingers, but he does not use his paw to strike a blow. The throat of the victim is generally seized from below, and death ensues from pressure of the windpipe rather than from any actual wound. Mr Inverarity believes that the victim suffers little or no pain, the sudden shock of attack producing a stupor and dreaminess in which there is no sense of pain or terror. Incidentally, he quotes the inquest Report upon a native who was killed in Salsette by a tiger, from which it seems that extraordinary verdicts are by no means confined to more civilised countries. The Report stated 'that Pandoo died of the tiger eating him; there was no other cause of death. Nothing was left but some fingers, which probably belonged to the right or left hand.'

A novel kind of sailing-vessel called the *Seafarer* has recently been tried at Southampton, with such success as to lead to the belief that it may cause some revolution in boat-building. Its new features are confined to the hull, which presents many peculiarities. The vessel is thirty feet long with a beam of seven feet; while her submerged part or draught is only twenty inches, including the keels, and this with a ton of lead on board to serve as ballast. At first sight the *Seafarer* does not seem to differ from other boats, and it is only when her submerged parts are examined that the novel points are apparent. Instead of having a section of U or V shape, as have other vessels, the *Seafarer* is shaped more like a W, with the angles well rounded off. As before indicated, she possesses two keels, and these are of brass, and are hollow, so that the water flows through them from end to end. The vessel possesses remarkable buoyancy, and is easily steered by a rudder, which also presents many new features.

The oft proposed scheme of substituting a photographic apparatus for the judge at the winning-post at horseraces has been adopted in Germany with marked success. Experiments in the same direction have also been recently carried out in America with such satisfactory results that at one well-known racecourse an official photographer has been retained. From these experiments it would seem that so-called 'dead-heats,' in which two, and in one case three horses were alleged to have reached the winning post exactly at the same moment, are impossible events. The photograph shows in such cases that there is really a difference of several inches between the horses' heads. It may be assumed that the photographic method would only be relied upon in very close races of the description just cited. There are certain difficulties in the way of its general adoption, the chief of which is the occurrence of dull weather, when a picture taken with the necessary speed, say the one-two-hundredth of a second, would be impossible.

The Manchester Ship Canal enterprise, which is

now making such good progress, seems to have had the effect of arousing other towns to the consideration of similar works. The Sheffield Chamber of Commerce has just taken up the subject of water-communication between Sheffield and the sea, their principal ground of action being the heavy railway charges which they assert are hampering the local industries. Bristol at the same time has under consideration a far more extensive scheme. Not content with easy communication with the Bristol Channel via the Avon, it is now sought to cut a canal to the English Channel from Bridgwater Bay to Seaton, in South Devon, thus separating Cornwall and Devonshire from Britain, and turning them into an island. Its adoption would mean a saving of three hundred miles to ships trading between Bristol and the English Channel, the Continent, and the Baltic ports; but whether these vessels are numerous enough to pay the expenses and interest on capital sunk in such a great enterprise is an open question. In these days of steam, three hundred miles is not a very long journey, and it may be presumed that many vessels would rather spend a little more time in rounding Land's End than pay the canal dues.

The use of compressed coal for domestic purposes seems to be rapidly increasing, a fact which we are glad to notice for the reason that what used to be regarded as a waste product is being utilised. The disposal of dust or slack had long been a problem with coal-merchants, and in many parts of the country, hundreds of tons had been allowed to accumulate. But for some time it has been known that the dust, when mixed with a certain proportion of crushed pitch and compressed in a mould can be converted into briquettes, which have a good marketable value. A new machine has recently been invented by Mr Mowll and Mr Messenger, C.E. of Dover, which will turn out these coal-bricks at the rate of five tons per day of twelve hours. The process is briefly as follows: The coal-dust, after being mixed with ten per cent. of crushed pitch and thoroughly incorporated by stirrers, meets a jet of steam, which softens the pitch and reduces the mixture to a plastic state. It now passes into a system of revolving moulds, each mould passing beneath a plunger, which thoroughly compresses the charge. An ejector pushes out the brick thus formed, and in about an hour's time it is ready for actual use.

There is a tinge of sadness in the thought that Brunel's leviathan ship, the *Great Eastern*, is after all to be broken up; and when we read of her being towed away for that purpose, we cannot help thinking of Turner's masterpiece, 'The Fighting *Téméraire* towed to her Last Berth.' The *Great Eastern* has not had a glorious career, it is true, but she did good work in laying the first Atlantic Cable; and besides this, it is impossible not to regret the destruction of a ship which, after all, was a triumph of engineering skill. It seems a pity that no better use can be found for the vessel.

All those who take an interest in scientific progress will be glad to know that the English government, after that long stage of deliberation which seems inseparable from official decisions, have consented to provide funds for the necessary instruments to take part in the projected photographic charting of the heavens. It will be

remembered that this magnificent international scheme was elaborated two years ago at an astronomical conference at Paris, and most of the principal observatories of the world had signified their consent to co-operate. Greenwich and the Cape of Good Hope observatories are now added to the number of those that will take part in the work.

A fresh advance in modes of locomotion is evidenced by the recent trial in London of an electrically driven dogcart. The vehicle will accommodate four persons, the accumulators or secondary batteries being placed beneath the seats. These batteries actuate a motor which is connected by chain-gearing with one of the hind-wheels. A speed of ten miles an hour upon an ordinary road can be maintained for five hours, the motor making at that speed about fourteen hundred revolutions per minute, and developing three-quarter horse-power. The complete weight of the carriage and its fittings is a little over eleven hundredweight. The movement is under ready control by the driver, who is able to regulate the speed to any required velocity. This new vehicle has been contrived by Messrs Immisch & Co., whose steam launches are well known on the Thames. What with air-driven tramcars, underground railways, cable haulage, and this last advance in electricity, it would seem that a time approaches when horse-traction in our metropolitan streets will be as scarce as it is—for a different reason—in Venice.

It was stated by one of the speakers at the late British Association meeting that no fewer than five million persons are dependent for their bread upon various adaptations of the electric current. We may surely assume that among these there must be many minds capable of original work who will in time blossom into inventors and aid the world's progress.

Mr L. A. Thompson of Philadelphia has secured letters-patent in all the principal countries for a new railway system for rapid transit in towns and cities, a system which depends upon gravity for its chief motive-power. Most of our readers must have seen at various exhibitions and holiday resorts the system of inclined planes and cars which constitute the so-called switchback railway. It is an elaboration of the same principle that Mr Thompson seeks to apply to the more serious business of locomotion in our streets. The general idea of the method is that of an elevated railway of light construction, having stations at frequent intervals. Between these stations the line will take a concave form, so that if a train be started from one side of the concavity it will travel by gravity to the bottom of the bow, and the impetus thus gained will carry it up the other side. But the highest point of the bow is not at the station itself but just outside it, so that a train will have to be pulled up to this point before it can start on its downward journey. This is done by a travelling cable of short length worked by a stationary engine, which the tram grips hold of when required. The system is very ingenious, and is likely to be adopted in many cities where an elevated railway of the New York pattern would not be tolerated.

In spite of all the recent controversy concerning the permanence of water-colours which led to the appointment of a Royal Commission to inquire

into the matter, one evil which seems to attack the very root of the question seems to have been strangely overlooked. It seems that in many kinds of drawing-paper used by artists in water-colours, chlorine is employed as a bleaching agent, the use of clean white rags which require no such chemical treatment adding enormously to the expense of manufacture. Traces of this chlorine, which should have been, but frequently are not, eliminated by after-treatment of the pulp with sulphite of soda, remain in the paper, and occupy themselves in bleaching certain of the colours placed upon it by the artist. Now that the evil has been noted, paper-makers will surely produce an article which shall be above suspicion. The sheet of paper which supports a water-colour drawing generally represents such a minute fraction of the sum for which that drawing sells, that the extra expense would not be grudged by any artist. In the case of drawings which do not command a good price, the presence of the chlorine would perhaps be an advantage.

It will be remembered that a gigantic raft of timber was launched last year at Nova Scotia, its destination being New York. The storms encountered during the voyage of seven hundred miles caused the monster structure to break up, and the timber was lost. But, nothing daunted, the promoters of the enterprise determined to build another larger raft, for they had proved that a structure of the kind could be launched and navigated. This second raft, or rather bale of timber, has not only been successfully started, but has reached its journey's end without mishap. In order that our readers may realise the gigantic scale upon which this novel structure is built, the following particulars are given. The raft is the shape of a cigar, and has a length just short of six hundred feet, its girth being one hundred and fifty feet, and its estimated weight ten thousand tons. The timber of which it is composed consists of tapering logs, which are about forty feet in length, and fourteen to sixteen inches in diameter at their larger ends. A monster chain forms the core of the structure, and this cable has smaller chains attached to it in such a way, and fastened at the outer surface of the mass of wood, that the stronger the pull upon the main cable, the closer are the timbers clutched together. The raft was towed by powerful steam-tugs, the journey occupying only eleven days. The twenty-two thousand logs of which it is composed would, under ordinary circumstances, constitute the freight of no fewer than forty-four ships.

Many housewives are now aware of the virtues of paraffin oil in saving rubbing and in cleansing clothes on washing-day; but it is not so generally known that another common product of the shale oilworks is even more powerful in its cleansing properties, while it has the additional good quality of being entirely destitute of smell. This useful product is paraffin wax, from which most of the better-class candles are now made, and which may be purchased from most drysalters or oilmen. Experience and practice will guide most people in the use of paraffin wax; but the following method has been found workable and effective: Melt half a pound of soap to about one ounce of refined paraffin wax, for every six gallons of water used. Boil the clothes in this for twenty minutes or half an hour, then rinse, and the washing is over.

No rubbing is said to be required, while the clothes are rendered beautifully sweet and clean, and entirely free from smell, which is an objection by many to the use of paraffin oil.

IN STRATHMORE.

THERE is a keenness as of coming winter this morning in the air. Heavy dew-beads as of frost lie on the tangled bramble sprays; and the southern sunshine sparkles along the forest path as if the grass there had been sown with jewels. The woods hang silent, clad in their richest robes of russet and yellow and red; while the fern fronds and grasses wait motionless below. The spot here is very quiet; not even a squirrel rustles in his hiding-place, and there is no wind stirring among the trees. Only a faint murmur of children's voices comes from behind the oak thicket in front. A brown and chubby brood these are—the children of the forester, from the little thatched cottage where the thin line of blue smoke is rising in the glade there below. They are seeking for blueberries along the edge of the plantation; and to judge by the dark purple stains on lips and fingers, the search is quite satisfactory. The banks beside the path are covered here and there with the modest shrub, its dim blue berries nestling like those of the mistletoe among the leaves; and the eager eyes of the little gleaners are quick to discover the most fruitful places.

Happy, indeed, will be the after-memories of children reared amid such surroundings. The little feet may tread many a weary mile hereafter on the rough highways of the world, and the innocent blue eyes may be dimmed with sad hot tears; but there will always be the far-off cloudless days of childhood to remember, when they gathered hazel nuts by the burn here, and wandered seeking blueberries on the skirts of these silent woods of home.

An unfrequented track down through the copse to the left serves to cut off a long bend of the road. A few acorns have fallen here among the grass tangles on the footpath, and many rich brown fir-cones lie about, already opened to scatter their close-packed seeds. A chestnut or two as well, their thick green cases split open by the fall, show here and there a knob of glossy red. The table-broad stump of an ancient monarch of the wood decaying close by upon the bank testifies silently to the degeneracy of the modern race around; while the trunk and upturned roots of a fallen ash, already covered with a wealth of green moss and fern and the delicate sprays of gray lichen, quietly demonstrate the eternal triumph of life over death.

In its channel below, the burn on its way from the lonely loch high up among the mountains, gurgles pleasantly under the narrow footbridge and between the stepping-stones as it flows through the woods to join the river. The trees and shrubs by its course bend lovingly over the water; and their wearied leaves, after coquetting all summer with the sun and wind, are dropping at last to die upon its faithful breast.

Beyond the bridge there is a steep climb up through the withering heather and brushwood by

the dry-dike side. Then the murmur of the stream is left behind, as well as the faint rumble of a cart out of sight far down the forest road ; and the snapping of a fallen twig underfoot sometimes on the mossy woodland path alone breaks the stillness that reigns in the sun-flecked solitudes. Once and again a brown leaf drifts down among the trees, and path and glade are strewn as softly and as deep, surely, as ever were the woods of old in Vallombrosa.

Well might the footsteps wander on through these solitary forest aisles, past the historic mansion silent amid its memories, and by the little kirk that once was the flaming tomb of eight score of a Highland clan, to the quiet village, six miles away, where the ground, it is said, sometimes trembles under foot ; for there will hardly be the sound even of a woodman's axe to disturb a reverie ; the rich fragrance of the red-branched pines hangs in the air, and many a nook of woodland loveliness lies by the way. Fortunate is he who can linger amid such scents and scenes ; for a pure and deep emotion is the love of them that will spring within his heart ; in falling leaf and soft-flitting wood-bird he will take again something of the simple pleasure of a child ; and it may be that amid these solitudes the gentle hand of Nature will smoothen from his brow some of the wrinkles that have been written on it by the iron pen of Care.

But see ! Down to the left, between the trees that interlace above this pathway of the fawns, a glimpse appears of the lake asleep in its hollow, heaven's own looking-glass, displaying as in an under realm the blue calm of the sky above. Only where the white swans are sailing does the long silver line of a ripple run caressingly along the grassy margin. Stately and royal birds are these swans, and as they steer far off along the lake under the shadows of the trees, they might almost be bearing away the unearthly barge of an Arthur or a northern Lohengrin.

A boat lies moored close by the level edge, and a gentle push sends it out along the unbroken surface of the water. Underneath, the leaves of bygone autumns still lie, brown and motionless, in the shallows ; and the dark back of a solitary carp or trout can be distinguished now and again gliding off among them. At long intervals, the note of a wood-bird tinkles here like a falling jewel amid the stillness ; the water, tranquil and pellucid, winds gleaming westward round wooded point and bosky islet ; while on every side, reflected in its depths, rise the burning glories of the dying forest-land. There the rich red copper of the beech, the withered yellow of the oak, and the delicate pale sprays of the fading larch, glow against the dark evergreen of the firs ; while the stems of the slender birches shine like silver among their own streaming tresses of Australian gold.

In the midst of all that splendour, quiet and gray above the lake, rises the manor-house itself. A time-enriched place it is, with the memories of other days lingering, like a faded fragrance, about it. Under its sheltering roof, in times gone by, beauty has shone, wit sparkled, and genius burned. For there it was that, just a hundred years ago, there tarried for a time that brightest son of song, the ill-starred Master-singer of Scotland, and there he was inspired to celebrate the

charms of the fair 'Flower of Strathmore.' No record remains of the words that passed between these two ; but doubtless the talk was gallant and gladsome, as the great-hearted peasant, whose soul spoke so eloquently and, alas for some, so dangerously in his eyes, wandered through these woods and, it may be, floated over these waters in that fair company. Did not he write of her as

Blithe by the banks of Erne,
And blithe in Glenturit glen ?

They have gone to their long home, poet and lady, and the leaves of many an autumn have fallen upon their distant graves ; but the place where their footsteps paused and passed is the richer by their memory ; a nameless charm lingers for their sake about the gray and still old house ; and the glades where their eyes met and their voices mingled almost seem themselves to be brooding silently over bygone days.

THE FIELDFARE.

WHEN wildly wave the poplar tops,
And scattered leaves the greensward mottle,
A worn invader seeks the copse.
She lights beneath a stunted bush,
And seems, to hasty eyes, a thrush,
But lacks the music of his throatle.

From freezing fiords has lain her way,
Where pines adorn some rock Norwegian :
There stands her home where skies are gray.
But now she seeks the English fields,
Where short November herbage yields
A refuge from that stormy region.

From year to year, when Winter's breath
Enshrouds the hills in misty sadness,
She flees as from the stroke of death ;
Yet evermore, from year to year,
As soon as earliest buds appear,
She seeks her mother-land with gladness.

Nor egg nor nursling will she leave
Within these hateful, strange dominions,
But hastes her homestead to retrieve.
Would Heaven that every human breast
With such unfailing truth were blest
As gilds the fieldfare's faithful pinions !

E. W. LUMMIS.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to insure the safe return of indigible papers.

THE OTHER SIDE OF THE HILL.

THE Duke of Wellington is reported to have said that the art of war largely consists in correctly guessing 'what is on the other side of the hill.' We do not know whether he was thinking of the physical conformation of the country, in valley and river and plain, or of the number and disposition of the foes concealed by the intervening elevation. Perhaps both. In either sense the saying is applicable to the warfare of life.

The art of war, then, has something to do with the art of guessing; and a guess, if a good guess, is more than a guess. We wrestle with language in so saying, and an explanation is needed. The popular notion of a guess is—a perfectly haphazard solution—a chance pebble-stone out of the scrip of possibilities, slung at the problem. Such an utterly random shot scarcely requires an intellectual effort. It is the 'pure guess.' But the intelligent guess, the guess of effort and insight, the clever guess, is the combination of acute observation and sagacious inference, assisted, perhaps, by experience and analogy. The 'hills' of life, on the other side of which lies our fate, are frequently composed of the characters, the actions, the behaviour of our fellow-men. If we can tell with reasonable certainty what A, B, or C will do upon considering the circumstances that have arisen, or upon learning what we have done or said, then we can guess 'what is on the other side of the hill,' and act with decision upon our conjecture. Take an illustration: Two men were aware that each of them was going to tender for an important contract. They were in a coffee-room together, and each believed, correctly, that the other was meditating his tender, as he sat with letter-paper and blotting-book before him. At last, one of them, as if his mind was fully made up, took his pen, rapidly wrote some figures, took the ink off on the blotting-paper, placed the paper in an envelope, directed it, and left the room as if to post it. Directly he had gone, the other stole up to the vacated seat, held the blotting-paper up to

the light, made out the figures of the tender, and with a chuckle at his own ingenuity, forthwith filled up a tender for a slightly lower sum, and duly despatched it. But he did not get the contract; and curiosity at last drove him to ask the other man how it was. 'I suppose,' was the reply, 'that you found out what you thought I had tendered?'—'Yes.'—'You found it out by spying through the blotting-paper?'—'Yes.'—'I knew you would, and I misled you.'

The successful competitor made a correct guess of 'what was on the other side of the hill.'

The Italian game of *Mora*—the same game as the English 'Odd or Even'—finds its fascination in trying to probe the workings of your adversary's mind. Agonising are the efforts of the guesser to follow the probable surmises which his adversary has formed as to the degree of the guesser's penetration. The intricacy of the mental operation resembles the bewildering repeated reflections of reflections in two opposing mirrors.

The mysterious success of some business men, and the equally mysterious failure of others as honest and industrious and capable as they, depend on this faculty of correct guessing at 'what is on the other side of the hill'—a faculty which, as we have said, resolves itself mainly into observation and inference, aided by experience. Can this be cultivated? Unquestionably. No doubt the Red Indian of our childhood was partly a manufactured article from the brain of Mr Fenimore Cooper and other story-writers; but we suppose he was partly genuine, and that his remarkable dexterity in following up trails was not the invention of the novelist. How did he succeed where the white man would fail? Simply by trained observation. Observation depends upon voluntary attention, and that depends upon the interest felt in the object. Sometimes there is a portentously rapid natural development of the faculty of observation, as in the case of falling in love. Conversation without language in the case of disembodied spirits becomes an intelligible and credible theory to those who have passed through that region of romance.

But the faculty may be cultivated in a more mechanical way, with no intoxicating fragrance in the air. Robert Houdin the conjurer used to train his little son by causing him to pass at an ordinary pace before a shop-front full of miscellaneous wares and then ascertaining how many articles he could specify. By constant practice of this kind, remarkable proficiency may be attained in rapid cognition of a promiscuous assemblage of things flashed at once on the retina. And the absence of this power in average persons is what the conjurer may safely rely on for the success of many of his experiments. By some gesture or sound he compels the attention of his observers for a second of time, and in a fraction of that second the trick is done.

Education in rapid and comprehensive observation would be absolutely essential as 'standard work,' if it were not for the discipline of life outside of school-hours. There is great educational value in many games full of sweet allurements to the faculties. The *Kindergarten* system takes full advantage of this. There are plenty of inevitable thorns in the pathway of personal evolution we are called to tread; it is well, therefore, to plant flowers, where we can, in the little learner's pathway.

'What is on the other side of the hill?' is a question which, when put by children toiling up the mount of knowledge, and the still steeper ascent of moral self-conquest, can receive a full answer, though it be not free from that solemn incertitude which besets the future of us all. We can show them, in the example of adult lives in progress around them, that 'on the other side of the hill' is the tableland of manhood; and on the gently descending slope towards old age there are men doing noble work for their families, their town, their country, their race, and generation, with tools like to those the children are fashioning and learning to wield in their classes and in their worthier sorts of games. Dear boy! let me set you on my shoulder! See the Black Knight waving his tremendous axe in semicircles of light. Listen to the crash as it falls on the oaken postern of the ruffian's castle, where Ivanhoe and Rebecca are imprisoned! The flinders fly at the mighty strokes. The brave helmet flinches not under the rain of stones from above. The postern yields. In rush the Black Knight and his followers, and the prisoners are saved.—Go back to school, my boy, fired with enthusiasm to become a doughty warrior in the battle of life against the enemies of the life-eternal, and learn to handle your battle-axe.

There is a large element of certainty in the contour of 'the other side of the hill;' but can we make any safe calculations in the uncertain region of the actions, tempers, fortunes, of the other men and women whose lives will press against our own? We may cast our own horoscope, so far as it is governed by our moral character in early life, our struggles and our conflicts, our victories and defeats; but the vast ocean of our uncertainty about the doings and failings of the crowd of other souls who will jostle us in our road seems at first glance somewhat terrifying.

Take an illustration: Here is a trustee, one of three trustees to whose care large funds are committed under settlement or will. He knows

his co-trustees are honourable and exact men; and the understanding is that he is to be a passive trustee, ready to act if required, but not bound to trouble himself till called upon to intervene. Years roll on; one of his co-trustees dies. Another, with the best intentions, through mere muddle-headedness, loses a great part of the trust money. Then rises up a new generation of the beneficiaries, without generosity, or memory of the original understanding. They turn upon the passive trustee and demand accounts, vouchers, proofs, for all the period of the trust, and cast on him the responsibility of every mistake and all the losses. It is easy to get some lawyer, who will take only a dry legal view of the case, to fight it, and then the victim becomes defendant in a Chancery action. He knows with what cold-blooded justice most of our judges investigate the transactions of trustees, and very probably, though his conduct may have been high-minded and free from blame before heaven, he suffers heavy damages and costs, or pays 'blackmail' to purchase his manumission.

Now, when that trustee made the kindly mistake of becoming a trustee at all, could he have conjectured what was on 'the other side of the hill?' Ask him; and he will possibly reply: 'I could not have guessed all; but I might have guessed much—guessed enough to have prevented my accepting the perilous responsibility.'

It is 'easy to be wise after the event;' but he would not be wrong in making that reply. Let us consider what he knew. He knew the Sinaitic rigour of the English law against trustees; he knew the large proportion of ungrateful souls among every second generation of beneficiaries; he knew that for the majority of the human race the power to get money by ungenerous and ungrateful ways gets the mastery of nobler impulses; and knowing all this, had he not the means of guessing what was on 'the other side of the hill'?

Illustrations in abundance swarm on us when we peruse the advertisements in our daily papers: large incomes to be obtained with very slight effort—enormous mineral wealth lavishly offered to the public by projectors bursting with philanthropy, and only requiring the trifling mark of confidence indicated by applying for shares and paying a deposit—money lent on mere personal security; and so forth. These nets do catch birds; those webs do entangle flies; fishes do bite at these baits. And then we have wails from the victims. But did they try, before parting with their money, to guess what was on the other side of the hill, behind which they fondly thought they saw the sunrise of their fortunes? Did they consider the extreme improbability of any one in this selfish world being so devoid of relatives and friends as to be compelled to spend money in finding recipients for his glittering benefactions? Did they inquire of experts, before they imitated the Vicar of Wakefield's son and made their final exchange for a 'gross of green spectacles?' They knew that selfishness, self-interest, cupidity, were certainly on the other side of the hill, and perhaps they admit they might have made a better guess as to the rest of the prospect.

How often, in married life, is there occasion to lament that either husband or wife, or both, did

not more correctly guess what was on the other side of the hill, before the irrevocable words were exchanged? There are many aids to good guessing—testimony of friends and relatives, known hereditary proclivities, manifest tastes and tendencies. Let us admit that the greatest sagacity cannot always foresee what is likely to happen; but very often bystanders, as they see the pair of lovers mount the hill and disappear on the other side, can hazard a not very wide conjecture as to what will be found there.

But there is one code, or index, of certainties about what is 'on the other side of the hill' which we have not yet opened—namely, the steadfastness of the moral as well as of the physical law. No one expects that on the other side of a literal hill water will flow upwards, or the law of gravitation tamely accept any insult, or light be reflected at any other angle than the angle of incidence, or sound-waves alter their velocity of vibration, or any other fundamental decree be changed. Yet there are people who seem to believe that on the other side of a metaphorical hill moral laws will be found entirely changed. Grapes will hang on thorns, and figs adorn thistles. Wild-oats are to be sown, and finest wheat reaped. If on 'this side of the hill' we firmly attach ourselves to some divine law or promise, the operation of which will not be exhausted on the journey, then we know what is on 'the other side of the hill'—namely, the working out of that law, the fulfilment of that promise.

'Across the border' is a phrase that starts many trains of meditation. How many times have we put our finger on one and another date in the calendar and said: 'On that day I shall cross the ridge; I shall look down into the valley on the other side of the hill, and enter on hitherto untried conditions of life.' There is the day when the lad leaves school 'for good.' One of the first twinges of sentiment that we can recall thrilled us when, in the dim light of seven o'clock on a December morning, we stood on the top of the hill opposite to that on which our boarding-school stood—the fly toiling up behind with luggage—and made out the obscure outlines of the house, the fir-grove behind, the fishpond in front, and well-known nooks and lanes that should know us again no more. The last view, in that winter's dawn, was so dim and ghostly, that it was more like memory than vision; and when the sun was up, we were far away. To how many horizon-lines, since our school-days, have we looked onward with the solemnity that befits the termination of an epoch, boundaries where we should take a farewell—half pitiful, half joyous—of the familiar, and clasp hands falteringly with the unknown! With what undefined misgivings, what plaintive music in the soul, as of an Æolian harp voiced by melancholy autumn winds, have we left the old and well-known scenes behind us, and gone forth to meet the new!

The words 'never more' subdue the heart like slow soft organ music in the hush of dying day. And yet we must all have noticed that however great the change of circumstance might seem as we approached it, no sooner had we actually entered its circle than it began to take upon it a familiar appearance, as a noble father's Hall

might do to the eyes of a boy stolen from it in babyhood by gypsies. That for which God intended and fitted us can never long be strange. We daresay a butterfly, the moment its wings are dry, and it has taken a flutter or two, feels as if it had been a butterfly all its life. The ransomed and purified souls that have been long imprisoned in the larva of the body and the chrysalis of the tomb, will flash into a glorious familiarity with their new and splendid conditions of existence when they rise to meet their noble destiny.

MR ESHOLT'S YOUNG WIFE.

A STORY IN TWELVE CHAPTERS.

By T. W. SPEIGHT.

CHAPTER IV.

ON the afternoon of the day following that of Peggy Myers's visit to Tydd Street, a cab stopped at the door of Mrs Strake's house, and presently the landlady in person appeared before Miss Granby, holding a visiting-card gingerly with a thumb and finger and a corner of her apron, for she had been interrupted in the middle of her breadmaking. Miss Maria took the card wonderingly, and read the name, 'Mr Robert Esholt,' aloud. 'Gracious me!' she exclaimed, dropping the card as though it were red hot; 'how has he found us out, I wonder, and what can he have come for? Dear, dear, and I with this shabby gown on!—Agnes, my love, not a syllable about the shirt-making.' She was all in a flutter, arranging her curls and her lace collar before the dingy glass over the chimney-piece.—'Now, Mrs Strake, I think you may show the gentleman in, please,' she said with a little gasp.

Then was Mr Esholt ushered into the dingy sitting-room, and coming forward, shook hands with Miss Maria. 'My dear Miss Granby,' he exclaimed, 'how happy it makes me to see you again after so long a time. Just the same as of old, I see. It might have been only yesterday that I saw you last, instead of fourteen long years ago.' Then turning to the white-faced invalid: 'You do not remember me, Miss Agnes, I daresay; but I have by no means forgotten you. The last time I saw you was when you were not much higher than this table. It was when I accompanied my brother Richard on one of his visits to the vicarage.—You are of course aware, Miss Granby, that I lost my brother some years ago.—He was one of your father's oldest friends, Miss Agnes; they were at college together, for Richard was originally intended for the Bar. Mr Granby wrote me a most touching letter, after his death, which I have to this day, and shall always keep.—But, as I was saying, my brother and I visited at the vicarage fourteen years ago. I was but a young fellow then, while Richard's hair was turning gray.—Do you know, my dear young lady, that you were rather fond of me at that time, and many a romp we had together?—I knew you again in a moment, for all you have grown up, and have not nearly so much colour in your cheeks as you had in those days.'

He had kept on talking with a view of giving the ladies time to recover from the nervous perturbation into which his unexpected visit had evidently thrown them. He now drew up a chair,

and sat down with the air of one who was determined to make himself at home.

'Pray, Mr Esholt,' said Miss Maria, 'if I may venture to put such a question, by what means did you discover our humble retreat?'

'Oh, that's a secret,' answered Mr Esholt with a laugh, 'which I am bound under heavy pains and penalties not to divulge.—And allow me, with all respect, to remark that I think it was due to the friendship which has existed for so many years between the two families to have informed me long ago that you were in Liverpool, instead of allowing me to make the discovery through another channel.'

'Mr Esholt, sir,' replied the spinster, flushing painfully, 'you must be aware that my niece and myself are no longer in the same position that we were in two years ago—that our worldly circumstances are now greatly narrowed. We thought it only due to ourselves not to press our indigence on the notice of those who had known us under happier circumstances.'

'Fie! Miss Granby. I cannot agree with your philosophy at all. What is a friendship worth that will not help to ward off the strokes of ill-fortune? But I will lecture you on this subject some other day, and succeed in converting you, I trust, to a belief in a more charitable creed. For the present it is enough that I have found you, and you may rely upon it that I shall not readily lose sight of you again. I have been informed, how or by whom matters not, that Miss Agnes has been ordered to spend a month or two at New Brighton for the re-establishment of her health; and judging from her looks, I can well believe such to be the case.—Now, listen, please. I have a cottage at New Brighton ready furnished, with a housekeeper in charge of it. It was bought and fitted up for the use of my sister, who generally passes some weeks there every summer. At present, however, she is in North Devon, and the cottage is empty. Now, if you and Miss Agnes will go and take up your abode there for as long a period as you choose to stay, you are truly and sincerely welcome to do so, and you will be obliging me very much into the bargain.'

Miss Maria's fingers began to twitch and tremble, and for a moment or two she was unable to utter a word. Then she said: 'Really, Mr Esholt, while thanking you sincerely for your most generous offer, I am compelled to say that we shall be under the necessity of declining it. Neither my niece nor myself could think of putting ourselves under such an obligation to any one.'

'Miss Granby,' said Mr Esholt more gravely than he had yet spoken, 'it is absolutely necessary, so I am given to understand, that your niece should have the benefit of the sea-air. The means of obtaining what she requires are placed within your reach. Do you feel yourself justified, allow me to ask, in refusing those means, and thereby retarding your niece's recovery, and all for a slight question of obligation, as you choose to term it? Had your brother and mine been now alive, do you think that either of them would have hesitated to accept such a bagatelle at the hands of the other? While the memory of their friendship is with us, do not, I beg, stand on such trifling observances.'

Miss Granby was silent, if not convinced. Her mental perturbation was great. At length she

said: 'I will leave my niece to decide the question for herself.'

Mr Esholt turned to Agnes with a smile. 'What say you?' he asked.

'Oh, as for me, no one but myself knows how I long to get out of these close stifling rooms,' she replied, looking out wearily across the hot street. 'I want to sit on the sands and watch the waves and to feel the cool sea-breeze. Were I to say otherwise, I should not be speaking the truth.—Don't be angry, Aunt Maria, but I feel as if I should never get well while I remain shut up here.'

Mr Esholt had won the day.

So, before he went, it was agreed that the ladies should cross the river to New Brighton the next day but one. Meanwhile, he would arrange to have everything in readiness for their reception, and would come himself at the time appointed and see them safely to the end of their short journey.

Robert Esholt at this time was thirty-eight years old. He was tall and inclined to be thin, and had a very slight stoop of the shoulders. He had a long thin face and a prominent clear-cut nose. All the lines of his mouth and chin spoke of firmness and determination of will; but his eyes, of the darkest brown, rarely lost the kindly look which was natural to them, and lent a softness to his expression it would otherwise have lacked. His whole bearing was that of a keen clear-headed man of business, who knew his own mind and had the courage of his opinions. Few faces were better known on 'Change than that of Robert Esholt.

Mr Esholt's visit passed like a freshening breeze over the parched lives of our two ladies. Next day, Agnes felt decidedly better than she had done since the beginning of her illness. She was in a pleasant flutter of spirits, and could talk of little else than Mr Esholt's kindness and liberality and how she should enjoy herself at the seaside. Mr Esholt was there to the minute, and saw them safely across the water and duly installed in Syringa Cottage. It was small, but tastefully furnished, and had a pleasant outlook across the mouth of the Mersey. The housekeeper and a girl were there to wait upon them; and by some magic of which they were not cognisant, they found their table furnished in a style to which they had been strangers since Mr Granby's death, with all those little delicacies so tempting to an invalid's fastidious appetite, especially when coming unexpectedly. There, too, they found a well-filled bookcase, and, what to Agnes was more precious than all else, a piano. Her own instrument had gone, one among so many other cherished objects, at the sale, and ever since her arrival in Liverpool she had felt like a stranger in a thirsty land for want of it. To-day, as she touched the keys caressingly with her fingers, she could scarcely restrain her tears. But for all that, she felt happier than she had felt for several months past.

Miss Esholt being still from home, the loneliness of his bachelor establishment seemed to strike Mr Esholt in a way it had never done before during his sister's absences, so he asked permission to visit the ladies occasionally, a permission which they were only too happy to accord. So on Saturday afternoon he left his office earlier than

usual and found himself at Syringa Cottage soon after two o'clock. The ladies were out somewhere on the sands, he was told, so he went in search of them. He saw them in the distance, Agnes seated in a donkey-chaise, and Miss Maria walking by her side. He stood for a moment or two to contemplate the picture, and then went forward to meet them. The crisp salt air and the sunshine, combined, it may be, with Mr Esholt's sudden appearance, had called an evanescent wild-rose tint into Agnes's pallid cheeks. Mr Esholt was struck with her loveliness—for loveliness rather than beauty was the term to apply to her—as he had not been struck before. The ladies received him with unaffected pleasure, and they all wandered about together till Miss Maria declared that Agnes had been out quite long enough. Then they went indoors and had a cosy cup of tea, after which Agnes played for a short time, and then Mr Esholt rose to go. They pressed him to come again as soon as possible, and he was glad to promise that he would do so.

A month passed away, and found Mr Esholt at the Cottage two or three times a week. The fascination grew upon him, and he could not resist it—it may be that he made no effort to do so. It was something new to him, and he smiled when he thought of it, to find himself in the middle of the day longing for five o'clock to arrive; to find his thoughts, even when on 'Change, veering in the direction of the Cottage, while his eye would glance up unconsciously at the large clock visible thence and note the slow lapse of time. The ladies were quite as eager to see him as he was to hasten to them. He occupied their thoughts and monopolised their conversation in a way which could not but have flattered him had he been aware of it, while his more powerful mind dominated theirs and coloured their lives far more than they suspected.

The autumn days grew shorter, and Christmas was within measurable distance, but still Mr Esholt would not hear of the ladies leaving New Brighton. Whenever Miss Maria ventured to broach the subject, he put her down in a quick peremptory way which fluttered her nerves for an hour afterwards, and made her afraid to hint at such a thing for at least a week to come. His visits were still as frequent as at first; neither wind nor weather kept him away. He was regarded by both ladies with a feeling of lively friendship—a feeling which his every word and action led them to believe was reciprocated. Nothing in his speech or manner betrayed anything beyond that; but all his life he had been trained to conceal whatever feelings it did not suit him to show on the surface. He wore a mask habitually in business, and it had become so far a second nature with him to do so that he often forgot, or did not care, to lay it aside in private.

One wet Sunday evening after his usual quiet farewell, Mr Esholt held deeper commune than usual with himself on his way home. Standing near the funnel of the steamer, buttoned up in his waterproof and smoking his cigar, he pondered deeply a momentous question. 'I am decidedly in love with this girl,' he said to himself, 'and have been from that first Saturday when I saw her on the sands.' He was too sagacious and clear-headed to deceive himself in a matter about

which so many men are self-deceived. 'The question is, Shall I propose to her or shall I break the affair off?' He never for a moment doubted his ability to do the latter. 'I have no reason to believe her heart is touched in the least, so that at present it is a question which concerns myself alone. I must go abroad shortly on business. Why not make that my wedding trip also? or else take the opportunity to break through this enchanted web as harmlessly as may be? But why not marry her, provided always that she would have me, which seems somewhat problematical? For one thing, there is a great disparity in our ages; but let me only succeed in touching her heart, be it ever so slightly, and that difficulty, if it be one, will quickly vanish.—But what would Janet think and say?' That was the most awkward question of all—one which brought him, as it were, to a dead-lock.

He was still turning the point over in his mind, considering it from different points of view, when the steamer reached Liverpool. 'Come what may,' he said as he walked slowly across the landing-stage, 'this day fortnight I will either propose to Agnes, or take the express train and break the neck of my passion by flying southward for a week or two after the swallows.'

True to his self-made promise, Mr Esholt let matters go on as usual for another fortnight, showing neither by word nor sign that such things as love or marriage had any place in his thoughts. On the day fixed by himself he sought an interview with Miss Granby, and told her that he was desirous of marrying her niece, and wished to have her consent to mention the matter to Agnes. Miss Maria could hardly have been more surprised had the proposal been about to be made to herself. She held Mr Esholt in the greatest respect, and stood somewhat in awe of him as well, so that her consent was readily given, though she could not help shedding a few tears as she gave it, while thinking of all that she and Agnes had gone through during the last two years, and of the bright prospect that had now revealed itself so unexpectedly before them.

Agnes sat like one spellbound when Mr Esholt told her in a few brief impassioned words how deeply he loved her. Frost-bound, rigid as a statue, she sat, even after those strange words had ceased; while he stood before her, his elbow on the chimney-piece, waiting for her answer. Even in the midst of her surprise and dismay, it struck her as somewhat incongruous to hear this grave middle-aged man of the world discoursing in such wise to a girl like herself. It was as though some long extinct volcano had suddenly burst through the snows of centuries and revealed the fiery heart at work below; for to her youthful imagination Mr Esholt seemed far older than he really was.

Mr Esholt changed his balance from one foot to the other, and without thinking what he was doing, looked at his watch. He had not the slightest wish to hurry Agnes, but his business habits kept the upper hand of him even at a time like the present. The movement, slight as it was, brought Agnes back to actualities and helped to steady her thoughts. 'I cannot answer you at once, Mr Esholt,' she faltered. 'I must have time to think over what you have said. You have surprised me so much that I scarcely

know how to express myself. My aunt shall write to you.' And so, like a pale ghost, she flitted from the room. In her heart she thought she knew quite well what her decision would be, but just then she could not find courage to put it into words.

All the following week Mr Esholt was more assiduous at business than usual, and more silent and self-absorbed in manner; only when his letters were brought in each morning he turned them slowly over one by one, as half hoping, half dreading to find that which seemed so long in coming. It came at last, a tiny billet in Miss Granby's crooked, angular hand, containing but three lines—an invitation to tea for the following afternoon.

Mr Esholt's proposal to Agnes had opened the old wound afresh, which time was beginning to heal over. She was startled to find how dear to her heart the image of Wilmot Burrell still remained. It seemed like sacrilege to think of marrying another. The image was overthrown, never to be upheaved again; but in her eyes it was beautiful still. Mr Esholt she respected, liked, looked up to with girlish reverence; but Wilmot, alas! she loved. Burning tears of love and shame watered her pillow again and again after Mr Esholt's declaration. Whether she married him or not, the future lay bare and bleak before her, uncheered by hope, without one ray of sunlight to brighten the path which led onward into the dim and unknown future.

Supposing she were to refuse Mr Esholt, she and her aunt could no longer continue to be the recipients of those kindnesses at his hands which had hitherto been put down to the score of the friendship which had existed between her father and the elder Mr Esholt. Indeed, their long sojourn at the Cottage had of late, as she knew, been a source of silent worry to Miss Maria, and it was only for the sake of her, Agnes's, health that they had not brought their holiday to a close some time ago. Now they must perforce fall back into that hard-working, poverty-stricken life from which, by Mr Esholt's kindness, they had been temporarily rescued.

CUSTOMS' OFFICERS AND THEIR DUTIES.

It is thought that a brief description of the duties performed by a hard-working and unobtrusive body of public officials may be of interest to the readers of this *Journal*. For this purpose, it is proposed to take the case of an imaginary Customs' officer named Robinson, and to trace his progress through the various branches of his routine duties.

Entrance to the Customs, as practically to all the other departments of the Civil Service, is now obtained by means of success in a competitive examination. The subjects in which the candidate is examined are of an elementary nature; but on account of the keenness of the competition, a very high standard of proficiency is necessary to ensure success. For the purposes of this paper it is assumed that the examination has been successfully contested, that the inquiries as to age and character have been satisfactorily answered, and that the medical officer has certified

that the constitution of our friend Robinson is sufficiently strong to endure the fatigue consequent upon the performance of his duties. This being so, Robinson will in due course receive instructions to proceed to his destined port, in order to enter upon a career, which was once described to a friend of mine, by an enthusiastic but not disinterested 'coach,' as 'having all the romance of the sea with none of its hardships.'

On arriving at his destination, Robinson is allowed a day's grace in order to procure lodgings. These, as a general rule, he will share with a brother-officer; for the guinea a week with which he starts life does not admit of unnecessary expenditure, but, on the contrary, compels him at the outset to practise the most rigid economy. He will now, probably, find himself one of several officers of about the same age and placed in similar circumstances; and as it is presumed that he is not a man of unsocial habits or temperament, he will probably experience but little difficulty in the selection of a companion from among their number.

The port at which Robinson is now stationed is assumed to be neither London nor Liverpool, but what is technically known as an 'outport,' of medium size and importance. Here he will find that his duties may be roughly divided into three great sections, each of which we will briefly describe.

The day of grace having expired, Robinson has to enter upon the duties of his new vocation. Punctually at eight o'clock he presents himself at the custom-house to sign the Attendance Register, and is then instructed that his first duty will be that which is commonly known as 'Rod and Basket Duty.' Robinson hereupon proceeds to a storeroom, from which he procures his various implements of war. These consist of a covered basket containing six sample bottles, a 'fench' for extracting spirits from casks, and last, but not least, some pointed pieces of chalk. From the examining officer whom he is deputed to assist he will in addition obtain a set of gauging-rods. These rods, together with the basket, &c., Robinson has to carry from warehouse to warehouse in the wake of his superior officer. In the bonded warehouse itself his duties are of a very simple and likewise of a very monotonous character. He has to attend upon the examining officer when that official is occupied in gauging the contents of casks. With the chalk he notes down on the cask-head the various particulars and dimensions as dictated by his superior officer, and with the fench he extracts samples, in order that their strength may be tested. Occasionally, Robinson may be required to supervise the operations performed in the warehouse by the merchants themselves; but the general nature of his duty will be such as has just been described. The work is monotonous in the extreme; but as the hours are not excessively long, he will possess a fair amount of leisure for recreation or self-improvement.

At the end of three months Robinson receives instructions that he must now take his turn at 'Rummaging Duty,' which, as the name implies, consists in the examination of vessels in search of contraband goods. This duty is entrusted to various superior officers known as 'tide surveyors,' each accompanied by two subordinates, one of

the class to which Robinson is supposed to belong; the other an unestablished officer or 'extra-man.' The staff in a medium-sized port consists of four tide surveyors and their eight subordinates. The *modus operandi* is as follows: Immediately upon the arrival of a vessel from a foreign port, she is boarded by the tide surveyor and his two satellites. They at once proceed to examine the baggage of the passengers, if any, as also the stock of tobacco, &c. in the possession of the captain and crew. This having been done, the vessel itself is subjected to a minute and exhaustive search. Bunks are overhauled, sails and coils of rope displaced, tons of iron cable lifted, and every nook and cranny made the object of thorough investigation. This work is of a protracted and arduous nature; but not until it has been completed does the tide surveyor leave the vessel.

Work commences at eight o'clock in the morning, and lasts continuously for twenty-four hours until eight o'clock the next morning. An intermission of twenty-four hours then occurs before the resumption of duty. This is effected by dividing the staff of tide surveyors, &c., into two sections, each of which performs duty on alternate days.

Robinson having commenced duty at eight o'clock in the morning, is busily occupied in rummaging fresh arrivals, and in re-rummaging vessels already examined, until six o'clock in the evening, with, if circumstances will permit, a brief respite for dinner. About six o'clock the whole of the staff repair to the watch-house, where three-hour watches are set, ship-fashion, for the next twelve hours. In the watch-house, sleeping accommodation is provided of a very plain description, usually consisting of a mattress, an uncovered bolster, and a pair of blankets for each officer. It must not, however, be imagined that Robinson will be able to secure an uninterrupted night's repose. Such an event may happen, it is true, but will not be of such frequent occurrence as the occasions upon which he will be continuously employed during the whole of the twenty-four hours.

During the time that the watches are in operation, the rest of the staff remain in the watch-house yawning or sleeping; while the officer on duty is stationed at the dock or pier-head on the lookout for fresh arrivals. Upon the approach of a vessel from foreign ports it is his duty immediately to notify the fact to the tide surveyor. He then arouses the two subordinates and also the officers stationed on board the vessel. The arousing of the officers and their arrival at the scene of action does not occupy much time; for, by experience, they are accustomed to be on the alert at a moment's notice, and soon slip on the boots, coats, and hats—the only articles of clothing of which they had divested themselves.

As the rummaging of a steamer takes at the very least two hours to perform, it will be seen that anything more than a cat-nap in the way of sleep is generally impossible. At six o'clock in the morning the watches cease so far as the ordinary outdoor officer is concerned; and at eight o'clock or thereabouts he is released until the next day.

The foregoing is a brief outline of a day's work as it would occur at an outport, although at different ports the details may somewhat vary. At

most it will be necessary that Robinson should occasionally help to man the Customs' boat in cases where vessels do not come into dock, but remain at anchor in the roads or river, as the case may be.

The performance of Rummaging Duty is not only laborious but, as may be supposed, little conducive to personal elegance. Robinson will probably at the outset have provided himself with a suit of overalls to protect his ordinary clothing, and will now become practically acquainted with the unique properties of soft soap for removing tar and grease from face and hands. He has to brave the utmost inclemency of the weather, and likewise the extremes of heat and cold; for it will often be his lot, when perspiring from every pore, to emerge from the engine-room or stoke-hole of a newly arrived steamer into the cold air of a gusty and drizzly night. The occasions also will not be unfrequent when he will incur great danger of finding a premature and a watery grave.

The tools required are neither numerous nor complicated; indeed, they may be said to consist of but two articles—a combined steel wrench and hammer, and a powerful bull's-eye lantern. The former is used for various purposes, but mainly for prising open; the latter is absolutely necessary, because the greater portion of the work is performed either in total darkness or in places very dimly lighted.

When three months have expired, our friend will be again transferred, this time to what is known as Boarding Duty. Robinson is now stationed on board a vessel from the time of her entry into port until such time as she again sails or is cleared by the Customs' authorities. It will be his duty to supervise the unloading of the cargo, in order that no portion may be surreptitiously removed; and he must also keep a sharp watch that the sailors do not convey any tobacco ashore. Robinson will generally be observed standing near one of the hatches supervising the operations of the stevedore, but occasionally quitting his post for the purpose of searching a sailor who is making his way ashore. As he is required to sleep on board the vessel, he will probably, from his experience of multifarious sleeping-places, become a philosophical campaigner before the expiration of his term of office. By the Customs' regulations, the owner of a vessel is required to provide the officers with sheltered accommodation; but Robinson will find that these regulations will be construed in widely different senses. In some cases he may be allowed the use of the cabin cushions; in some he may be granted the use of the chart-room; and in some he may even be furnished with a bunk; but, on the other hand, it will often be his lot to be provided with no better accommodation than a few sails, or the top of a sailor's chest in an unsavoury fore-castle.

Boarding Duty is performed by either one, two, or three officers, when it is respectively known as Single, Double, or Treble Boarding.—Single boarding is the method adopted in the case of small vessels, or of vessels which, from the Customs' point of view, are of no great importance, and which will often remain in port for a considerable time. One officer is stationed on board, where he will remain for the whole period of her stay. A reasonable amount of time is allowed for

sleeping purposes, and, beyond the monotony of the duty, no great hardship is incurred. The officer will, however, in many cases be compelled to remain on board for a fortnight or three weeks at a stretch.—Treble boarding is the method adopted in the case of very large vessels, where it is considered that for the protection of the revenue three officers are necessary. Here the officer, although often on board for a considerable length of time, will obtain eight hours' sleep each night; but every third night this sleep will consist of two portions of four hours, with an intermediate watch of four hours on deck.—Double boarding, the method adopted in the case of vessels of medium tonnage, is at the same time the most common and the most laborious. Indeed it is probable that at an outport, Robinson will be little acquainted, if at all, with the other two methods. Two officers are stationed on board a vessel, where they remain during the whole of the time she is in port. With the exception of the periods allowed for breakfast and dinner, both must be on deck from six o'clock in the morning until six in the evening. The remaining twelve hours are divided between them for sleep; one officer being on deck while the other is below. The authorities do not permit an officer to keep the same watch on two consecutive nights, and hence each is compelled every alternate day to keep a continuous watch of twenty-four hours.

In order to explain the nature of the duty and the alternation of the watches, it is assumed that a vessel arrives in dock on Monday morning. Robinson and another officer are immediately stationed on board. Both remain on deck until six o'clock in the evening, when Robinson goes below for six hours. The probability is that during these six hours he will be unable to obtain much if any sleep. At midnight he is aroused by his mate, who then turns in for six hours. Robinson has now to remain on watch for the next twenty-four hours, until twelve o'clock on Tuesday night, when he again turns in. On Wednesday he will be on deck for twelve hours, and on Thursday again twenty-four. This alternation continues during the whole of the time (from three to ten days) that the officers are stationed on board. The time allowed for sleep is sufficiently scanty even if obtained in its entirety; but as it frequently happens that a vessel does not arrive in dock until a late hour in the evening, or, when in dock, works after hours—in which event both officers must remain on deck—even this allowance is often curtailed.

Robinson will now find that although he has been to a certain extent inured to hardship by his experience of rummaging, the fatigue entailed by the performance of boarding duty will be a serious strain upon his constitution. Eighty to ninety hours will be no uncommon week's work; and it is possible that he will in one week be on duty for one hundred and thirty-two hours, including meals, &c., out of which one hundred and eight will be occupied in actual watch.

While on boarding duty, it will be often a difficult task for Robinson even to keep his eyes open. Many will be the temptations to take a short nap; but these temptations, however strong they may be, must be strenuously resisted. The officers are visited at unfixed and uncertain periods

by the tide surveyors, and woe befall our friend if at any of these visits he be found napping! Such an event would, in the first instance, incur for him a severe reprimand, and if repeated, would entail the loss of his commission.

While employed at boarding duty, Robinson will obtain but little leisure, and of such leisure a small portion only can be devoted to purposes of recreation or self-improvement. As the hours allowed for sleep are few and irregular, our friend when relieved from duty will generally find himself so thoroughly overcome by bodily fatigue, that, probably, it will be his first care to get between the sheets as speedily as possible. He will consider himself especially fortunate if he be able to sleep at home during two nights in any one week; and cases will occur in which he will not pass a night at home for a considerable period.

At some ports the system of boarding has been superseded by what is known as Patrol Duty, the mode apparently in vogue at French and Belgian ports, and the nature of which duty is not dissimilar to that of an ordinary police constable. The various docks, &c., are divided into sections, for one of which an officer is responsible, in the same manner as a policeman for his beat. In these circumstances each officer is on duty eight hours a day.

At boarding duty, Robinson will probably be retained for a period of three months, at the expiration of which he will again be transferred to the bonded warehouses; and in the regular rotation of warehouse duty, rummaging, and boarding, he will be employed for the next four or five years. At the expiration of that time, if not previously promoted, he will probably be relieved from the performance of the latter two forms of duty, and henceforth his work will be confined to the bonded warehouses. By seniority and merit, he may then obtain brevet rank, and be employed in cases of emergency as gauger or tide surveyor.

In the foregoing sketch, the ports of London and Liverpool have been purposely excluded, more especially the former. Everything at these ports is necessarily on a larger scale than at an outport; consequently, at these ports the officer to a certain extent becomes a specialist, and is confined more or less to one class of duty. At London, for instance, Robinson would have no experience of rummaging duty, as that duty is performed by a separate class of officials; but for the first four or five years of his career he would be employed at the still more arduous and uncongenial boarding duty.

Thus far we have traced the career of the outdoor officer, and here it is proposed to leave him. He may, it is true, attain to higher positions; but the life as previously sketched is the life of the rank and file, who, as may be supposed, form the great majority.

At the expiration of three years, an outdoor officer is qualified to compete for the position of examining officer, which promotion is the reward of success in a literary competitive examination. If successful, he will be eligible thereafter for promotion to the highest positions in the service; for, like the private soldier of Bonaparte's army, the outdoor officer, figuratively speaking, carries in his knapsack the bâton of a marshal.

There would appear to be a somewhat common opinion abroad according to which a Civil Servant is regarded as a person who, for a high salary, does nothing six hours a day, and who, in order to recruit his exhausted energies, requires an annual vacation of not less than six weeks. It will be seen that the Customs' officer at least cannot with justice be included in such category. *Sinecures* in the Civil Service, if existent, should in the true interests of Civil Servants themselves be instantly abolished. Any scheme of reform, either in the Customs as a department or in the Civil Service as a whole, must ultimately benefit the rank and file; and by the rank and file such measures of reform should be not only ardently desired but eagerly sought for. Among those who would participate in the benefits of such reform, not the least worthy would be the outdoor officers of Customs, the career of one of whom has formed the subject of the preceding sketch.

A FAMILY SECRET.

IN FOUR CHAPTERS.

BY CHARLES GIBBON.

CHAPTER I.—WHO IS SHE?

JOE SUFFLING, miller, was making his way home rather late at night across a broad stretch of sand-heaps and sand-hollows, diversified with patches of green turf and low-lying clumps of gorse, locally known as the Denes. On one side, the Denes are bounded by the sea; on the other, by many miles of marshland made profitable to graziers by drainage. The moon was at its full, and there was little wind, so that the deep voice of the sea was a murmur rather than a roar.

Joe's windmill stood in a solitary position on the common, about a mile north of Great Yarmouth market-place. It was not a spot likely to be visited at that time of night by strangers for mere pleasure. Two of the long arms of the windmill rose up like black shadows in the moonlight; and as Joe advanced cheerfully towards his home, with steady steps accustomed to the uncertain nature of the ground, he was startled by an unexpected sight and halted staring. A tall woman stood motionless on one of the bits of rising ground. She was dressed in black and was gazing seaward. She stood so still that Joe thought the figure was like a black stone statue, for the wind did not stir the folds of her dress. She was standing directly in Joe's path not far from his gate, and he must pass close by her, unless he made a circuit down one of the deepest of the sand-hollows. He hesitated for a minute and then proceeded, saying 'Good-evenin' as he passed.

The woman did not respond or move, and the whiteness of her face scared the miller, with the fancy that she might be a corpse. Unpleasant as the fancy was, he could see that the face was very beautiful, and instinctively recognised her as a lady.

'Nan,' he said to his wife as he burst into the cottage, 'there be a lady standin' out yonder like one o' them stone statues in the Duke's gardens—only they be white, an' she all black, barrin' her face—that be as white as death.'

'A lady standin' out there at this time o' night!' exclaimed the buxom wife incredulously. 'Some gipsy tramp, more like.'

'Nay, none o' that sort. Yeow come an' look for yeowself; she be nigh the gate.'

'Did yeow speak to her?'

'I gave good evenin'; but there was never a word or sign in answer. Maybe she be in one o' them fits that fixes yeow so that yeow can't move.'

Nan had a warm heart for any sufferer, and at this suggestion went out at once to the gate with Joe. She saw the motionless black figure standing in the moonlight about twenty yards from the gate; and brave little woman as she was to live with her husband in such a solitary home, a thrill of superstitious awe passed over her. The hour, the place, and the hushed wind, with the deep moaning of the sea, combined to suggest that there was something uncanny in the appearance of that lone black figure. The appearance of a black dog late at night foreboded death to some one. What might not this strange visitant bode?

'Yeow go speak again, Joe,' said Nan in a low voice; 'an' if she be in trouble or have lost her way, ask her to come into ours.'

'Hadt' yeow better go?' answered the husband sheepishly. 'Likely, she'd speak to a woman more free than to a man.'

'No, go yeow; I'll be here ready to come if wanted.'

Joe hesitatingly once more advanced towards the black figure, and, as his footsteps could not be heard on the sand or turf, he coughed loudly to make his approach known. But no effect of that kind seemed to be produced. When within a few paces, he halted. 'Beggin' pardon, ma'am,' he said respectfully, 'but my missus have sent I to ask if so be as yeow have lost yeowr way?'

The head moved, and two bright dark eyes shone upon him from the white face. She answered in a tone that had no feeling in it—not the faintest note of gratitude for the evident kindness of the miller's inquiry: 'No.'

'Maybe yeow want to find some place here-about?'

'No.'

Joe pondered for a minute: if she had not lost her way and did not want to find any place thereabout, then that fixed gaze towards the sea had a terrible significance.

'Ben't there anythin' we can do to help yeow?' he said as a last attempt to understand the position.

'No.'

He looked at her pityingly and much puzzled. She was again looking fixedly seaward. He was about to turn away in order to come to consult Nan as to what had better be done next, when there was a moan, and the woman fell to the ground. The miller was on his knees beside her in a moment, lifting the inanimate form, whilst Nan scurried across to his assistance.

'I knowed the poor creature were a-thinking of drownin' herself,' said Joe; 'an' she been a trying of it already, for her skirts be drenched with water.—Lost heart, I suppose, an' turned back without havin' quite made up her mind.'

'Lord ha' mercy on us!' exclaimed Nan piously and sympathetically, 'whatever can ha' tempted her to that?'

'Lord alone know.—But yeow run on, Nan, an' get a place ready for her to lie on, an' I'll carry her in.' He lifted the stranger in his strong arms as if she had been an infant and carried her into the cottage. Nan had hastily stretched out one of those small iron chair bedsteads before a blazing fire in the kitchen, and he laid his burden upon it.

'She look like dyin',' whispered Nan, hastily unfastening everything about the lady's neck and taking off her bonnet.

'She do,' acquiesced the miller; 'an' that be awkward for we, seein' as we know nothin' about her. Maybe we ought to tell constable.'

'Constable!' ejaculated Nan indignantly, for the deathly white face had won her keenest sympathy. 'The poor thing be in dire trouble o' some sort. Take the pony an' fetch the doctor—that be what yeow are to do; an' I'll get off them wet things an' put dry ones on her.'

Joe rarely disputed any decision of his wife, especially when it was, as generally happened, on the side of kindly action. He therefore harnessed the pony to a light spring cart and drove into Yarmouth for the nearest doctor.

'Yeow see, sir,' said Joe in response to the doctor's expression of astonishment that he should have taken so much trouble about an entire stranger, 'we couldn't let her die at our very door as it might be without tryin' to do somethin'. There weren't likely anybody else to come that way to help her.'

'Very good of you; and your place is so lonely that it is most mysterious how she should come there.—You say she is a lady?'

'A born lady, I'll be bound.'

'Some family rupture, no doubt,' muttered the doctor.

They were driving back to the mill during this conversation, and the doctor was wondering if he should find in this curious case a commonplace incident of domestic quarrel and a passionate woman foolishly attempting to commit suicide, or something of a more romantic nature.

John Aynsley was only thirty-five, and he had not yet lost the speculative imagination of youth; so that the circumstances which Joe had detailed interested him and set his fancy at work.

On arriving at the mill, the patient was still insensible; but her wet things had been removed, and she was now wrapt in warm blankets, whilst Nan had a cup of tea ready for her as soon as consciousness returned.

When Dr Aynsley took the lamp which Nan offered him, and examined his patient's face, he started, and with difficulty restrained an exclamation of surprise. He looked more closely, and then mentally said: 'No—it cannot be. It is impossible—and yet the resemblance is very striking.'

When he rose from his stooping position there was professional calmness in his manner and expression. He had brought with him such restoratives as he deemed requisite—from Joe's description of the case, and he now proceeded to apply them. Nan had already tried burnt feathers sedulously, but without apparent effect. Now, however, the woman began to breathe more audibly, and by-and-by, after a long inspiration like a heavy sigh, slowly opened her eyes. They

blinked as if the light pained them, and the doctor motioned to Nan to put the lamp aside.

Whatever recognition there might have been on Aynsley's part, there was no recognition of him in the invalid's eyes. They were fixed on him with the same stony stare with which she had regarded the miller. There was no meaning in them. The expression was that of a somnambulist. Although life was restored to the body, it was evident that the mind was still vacant. Suddenly she attempted to rise; but her spasmodic effort failed to do more than slightly raise her head, which instantly fell back on the pillow. Then there was an hysterical sob, and the young doctor was not displeased to hear it, for to him it was a sign of returning sense. But to Nan it was a most distressing sound, and although not given to such weakness, she gave vent to an involuntary sob in sympathy. They were all startled by what followed, and the miller and his wife drew back a pace, as if frightened.

'My babe, my babe!' murmured the woman gaspingly; 'they say I caused your death. I!—I!—I!—But they wish me dead, and they will have their wish.—Oh, my babe!'

'This is some delusion due to severe mental distress,' hastily whispered the doctor to the horrified couple who had succoured the stranger. 'Pay no attention to anything she may say in her present state.'

'They wish me dead, and they will have their wish,' repeated the sufferer, more distinctly than before, whilst she moved nervously on the narrow couch, as if struggling to rise from it.

The doctor succeeded in administering another dose of medicine—a sedative this time—and in a little while it appeared to soothe her. She closed her eyes and seemed to sleep. Whilst giving the draught, the doctor observed a gold locket on her neck bearing initials. 'It is she!' he muttered to himself: and then turned to Nan: 'Have you a spare bed?'

'That we have, but'—

'It is impossible to remove the lady at present,' interrupted the doctor. 'I know who she is, and you will have no reason to regret any kindness you may show her.'

'We don't want nothin' for doin' as we would be done by,' answered Nan frankly; 'but it frighten me to hear what she say.'

'I have told you that she is suffering under some temporary delusion, from which she will recover with a few days' rest. I know the lady, and will be responsible for her.—You need fear no risk in sheltering her till she can be safely removed elsewhere. She has been evidently suffering severely both in mind and body.'

'That be clear enough, poor deary,' said Nan, again all sympathy; 'an' mayhap it be the loss of her little one that have upset her.'

'Not a doubt of it; and the loss of the child accounts for her being dressed in black, as your husband told me she was.'

'That be true, an' I'd never believe that such a fine-lookin' lady could ever do anythin' so dreadful as she was sayin' some un say she did.'

'I'll stake my life on that.' This was uttered with such impulsive earnestness, that Nan's quick eyes scanned John Aynsley's face, and discovered the secret he had thought long buried in his own heart, never to be revealed to mortal.

'Since yeow know the lady, doctor,' observed the good woman softly, 'what may her name be?'

At this question Aynsley looked unaccountably awkward. Recovering himself, he took the patient's left wrist gently as if to feel her pulse, but he glanced at the fingers and saw the wedding ring.

'For the present,' he said in an undertone, 'you may call her Mrs Fairfax.'

During this whispered conversation, the subject of it had remained perfectly motionless; but careful as Aynsley had been, the sound of the name he gave seemed to reach her. She started, shivering as with cold, and looked up wildly, but did not speak. He saw that he was still unrecognised, and was glad of it.

'You are better now,' he said gently, 'and you will soon be well, for there are kind friends beside you.'

'Kind friends!' she echoed feebly; 'my father is dead; my babe is dead, and I have no friends.'

'Hush! You must not speak now. You must rest.'

The strangely bright dark eyes were fixed on the man's face with an inquiring expression. She seemed to be searching her mind for some lost memory, and failing to find it, the eyelids closed again.

He turned away as if for some reason, eager to escape from that searching gaze. 'I should like to see her settled for the night before I go, Mrs Suffling. Can you manage to get her into bed?'

'Surely, for I can lift her as though she was a child, tall though she be.'

'Then your husband and I will take a turn outside until you call us.'

The miller had been all the time standing aside, alternately scratching his head and observing the speakers. He was much puzzled by what he saw and heard, but discreetly left the whole management of the strange affair to his 'missus' and the doctor. He felt it a relief to get out into the fresh air; and as a still further relief to his perplexed wits, he instantly lit his pipe.

The miller's cottage stood under the shadow of the mill and within a dozen yards of it. The dwelling was a long low one-story erection, the walls constructed of small flints deftly plastered together. There were no windows on the east side, for the cruel east wind had to be kept out by every practicable precaution. A long black wooden shed served for stable, cart-house, cow-house, and piggery.

Joe Suffling was in his way a prosperous man, and on ordinary occasions was fond of calling the attention of any visitor to the improvements he had made and intended to make about the place. The moonlight was sufficiently clear to have enabled him to indulge this harmless vanity even now; but his thoughts were otherwise occupied. They found expression in this abrupt fashion: 'I don't like this business, doctor—not that I doubt but you'll see we all right. But there ben't no manner o' question she was a-tryin' to drownd herself; an' it 'ud be awkward if she tried it again while in our hands.'

'She has not strength enough to walk a dozen yards without help.'

'I see you start when yeow look at her, sir,' continued the miller, 'an' I say to myself—That

be good. Doctor know her. Seem to me, then, that bein' so, her friends ought to be brought here at once; an' if they be anywhere about here, though it be five mile off, I'm willing to go, late as the hour be.'

'Wait till I call in the morning, Suffling. Then I expect Mrs' (a little hesitation here) 'Fairfax will be able to explain matters to me, and I shall know what to do.'

'But maybe her friends be in a way about her.'

'Her friends may be; but think what a storm there must have been to drive her from amongst them! We must think of her first, and of her friends afterwards. They must have been very cruel to her in some way.'

'If I was sure of that'—

'Never mind them at present. Let us wait to hear what she has to tell and learn what her wishes are. You and your wife have acted most generously and kindly; don't spoil it all by talking about her friends. They must be strange people to have driven her to this.' The last sentence was spoken to himself rather than to his companion, and there was a distinct tone of bitterness in it.

The miller took several long meditative whiffs and then he spoke: 'So be it, doctor: I say no more. I'd be mortal sorry to do anythin' that 'ud make the poor lady worse than she be already.'

They had been walking up and down, and at this point they were near the door of the cottage. Nan was standing at it.

'She be abed now, sir, an' quiet as a lamb.'

The doctor saw his patient again. She was sleeping calmly and breathing regularly. He gave Nan sundry instructions, and promised to be with them early in the morning. Joe offered to drive him home, but the doctor preferred to walk. Strangely, too, he preferred the longest route—that over the Denes and by the shore, instead of the highway. He had been much more agitated than his manner suggested whilst in the cottage, and he wanted to walk it off. There was something peculiarly painful, after years of absence and silence, in meeting under such strange circumstances the woman he had loved—and found he still loved.

John Aynsley's father had been a clerk in a Norwich bank—a quiet, retiring man, without any of those qualities of 'push' or 'go' which are necessary to procure promotion. No fault was ever found with his figures; he was steady and painfully industrious in the discharge of his duties. Yet, whilst he plodded faithfully on through the routine of his daily office-work, younger men passed him rapidly, and he was doomed to remain a mere book-keeping machine at a salary of one hundred pounds a year. On this income he married, and, as is generally the case with people who have small means, he was blessed with a large family—eight, seven of them being daughters. He was still further blessed, however, in having a shrewd practical wife, who was skilled in domestic economy, and could make a leg of mutton last as long as if it had been a whole sheep.

John was the eldest of the eight, and inherited his mother's abilities. He early distinguished

himself at school; he won scholarship after scholarship, so that from the age of fourteen he did not cost his parents a penny. He had decided upon entering the medical profession, and at twenty he obtained his degree of M.B. Immediately thereafter he was engaged as assistant to a country practitioner, and through the following years was able to give material aid to his parents. At twenty-four, having attained the dignity of M.D., he became assistant to Dr Fairfax, who had an extensive practice in Norwich, and an only daughter, Mina. Then commenced the sorest trial of John Aynsley's life. The girl was little more than sixteen, but she was so tall and so dignified in her bearing, that she appeared to be a full-grown woman. The gentleness and simplicity of her manner did not alter this impression, and those who saw her preside at her father's table—for he had been long a widower—were astonished when they learned her age.

John Aynsley was in love. He knew it, and bravely combated the most glorious vision of happiness he had ever known or could ever hope to know. He dare not think of it, remembering that his parents needed help with their troop of girls. He dare not think of it—at least not for years to come, when he should have won a position which would entitle him to speak. Therefore, he spoke no word; and yet sometimes Mina was so frank and kind with him that he fancied if circumstances had been different he might have won her. He put the fancy away from him as arrogant madness. But the temptation to speak was terrible. He struggled against it for a year; and then he decided that he must save himself by flight. So he announced his intention of leaving Norwich. Dr Fairfax, not suspecting the reason for Aynsley's sudden determination, and knowing his value as well as feeling deep interest in him, endeavoured to dissuade him from it. He even hinted at the prospect of arranging a partnership at an early date. But there was only one arrangement which could have altered Aynsley's resolve, and he saw no prospect of that being made, kind as his friendly chief was; so he carried out his plan. He sought and obtained an appointment as medical officer on board an emigrant vessel, and for about eight years continued to serve in that capacity on various lines. He saw much of the world, made many friends; but Mina was in his heart still—the hopeless love for her as strong and painful as ever.

Whilst at Bombay, on the last voyage he intended to make before settling down on shore, he received a letter from one of his sisters, which, amongst other items of home-news, contained the following passage: 'By the way, do you remember Mina Fairfax?' (Did he remember! As if he ever could forget!) 'She is going to be married. I believe it is a great match—some rich young county Squire. I don't know who he is, as the affair is to be conducted very privately, and I suppose there will be no cards.'

He felt a twinge of pain, and a sense of sickness for a few moments, thereby understanding that in spite of himself, in spite of time, absence, and protestations that he must not think of ever winning Mina Fairfax, there had lurked somewhere in his heart a shadowy hope that some day fortune might favour him.

He was depressed by the news, but not sur-

prised. He only wondered that she had not been married sooner—she was so beautiful and gifted. He was sorry to discover that unconsciously he had still cherished vain hopes, and now it seemed a relief to know that he must think of her only as a loved one dead. He might indulge in sweet memories of the dead, although it was denied him to think of her living.

So he made no inquiries about the marriage; and even when he returned to Norwich, some time afterwards, he never asked the name of Mina's husband. That was why he had looked awkward when the miller's wife asked the lady's name, and had answered: 'For the present we will call her Mrs Fairfax.'

TIMBER'S HIDDEN ENEMIES.

ANY one who has given the matter a thought must have been struck with the amazing length of time it takes for knowledge of any kind to filter down to the masses, and in no case is this more glaringly apparent than in the manner of treating timber in building. In spite of the voluminous warnings and admonitions that have gone forth on this head, the old mistakes and antiquated erroneous systems are repeated and perpetuated day by day. Like all else in this world of change and decay, timber must eventually yield to the inevitable 'dust to dust'; but that is no reason why we should not endeavour to postpone the evil day by every means in our power, by invoking the aid of science and the experience of former generations. The following remarks are confined exclusively to timbers that are hidden from sight, such as floor-joists and ends buried in masonry or in the earth, all of which lie within the province of the carpenter, not trespassing on that of the joiner, whose handiwork in the shape of doors and windows is fully exposed to view.

Since the quality, strength, and durability of timber are all greatly influenced by the season in which the tree is felled, we may state that winter, when but little sap is flowing, and the various fungi are dormant or dead, is the fittest season in this country; that trees which have nearly done growing afford the best timber, as there is but little sapwood in them, and their heartwood is in the best condition; and that as soon as possible after felling, the bark should be stripped, the trunk roughly cut up into the forms that it will eventually be required to serve, and the pieces stacked to season, under cover, if possible, in such a manner as to admit the greatest quantity of light and air. Timbers that have been thoroughly well seasoned and properly placed in position have been known to last without any apparent deterioration for several hundred years. In an ever-growing country like England, where the number of buildings increases year by year, it is an absolute impossibility to keep up the necessary supply of properly seasoned timber, which unfortunate fact should spur us to employ every

artifice and means to lengthen the period of its healthy existence.

Its greatest enemy in this country is undoubtedly *dry-rot*, though how the epithet 'dry' ever came to be applied to this fungus, the very essence of whose existence is moisture, has always been a puzzle. It must have arisen either from the fact of its effect in the shape of wood reduced to powder being more often witnessed than the living organism which caused it, or from the necessity of distinguishing it from *wet-rot*. Its scientific name is *Merulius lacrymans*, or *Boletus lacrymans*, so termed from the moisture that drips from it like tears. It is one of the few members of the fungus tribe that, like the mistletoe, bears leaves, which in its case resemble those of the vine. It must not be confounded with the *Polyporus hybridus*, or fungus called the agaric of the oak, with which the Druids of old played many tricks, for this is the child of the oak itself, and the direct cause of the hollow old oaks we have all seen, as well as being answerable for the decay of oak beams and planks that have been laid improperly seasoned. When once the dry-rot fungus has obtained a footing, it will in a very short time destroy all the woodwork in a house, insinuate itself into the interstices of the walls, crumbling them to pieces, play havoc with books by reducing the leaves to tinder, and in fine cause so much mischief as to render a house uninhabitable and necessitate its demolition.

There is no reason, however, why it should ever obtain a footing. We have only to bear in mind that it is a creeping plant, which cannot rise unsupported as high as two inches, and that it has no adhesive powers except in contact with wood, so, if there be no contact of wood with earth, it is harmless. Fortunately, it cannot pass over brick or mortar, else it would rise from our damp cellars and infect half the houses in the kingdom; so the first precaution is to raise all woodwork in the basement on a bed of brick or stone; and if to this condition be added a free circulation of air around the timbers, by inserting gratings in the walls or by other means, so as to prevent an accumulation of the confined and damp air so material to its growth, the chances of its appearance are nil. For the same reason, when laying wall-plates or fixing the ends of rafters a clear space of about an inch should always be left above them and on each side. We have seen an immense roof literally resting on air, the ends of its supporting timbers, owing to the neglect of this simple precaution, having entirely rotted away; the only thing that kept it from falling bodily was the cohesion of its component parts. The practice of covering our floors with oilcloths instead of carpets soon rots them, by stopping the circulation of air; and the custom of keeping tightly closed all the windows of a newly built house, whose walls are full of moisture, in place of leaving them wide open, places the woodwork in an atmosphere more charged with vapour than its own internal contents, and keeps it thereby in an imbibing, in place of an exhaling state, thus sowing the seeds of early decay. If the best seasoned stuff be shut up under such conditions, the quantity of moisture it will imbibe will defeat all the former care that has been expended on it. We pointed out in our article 'A Few Common Errors' (Jan. 7,

1887), the fallacy of attempting to dry a building with gas.

We now pass on to the consideration of those timbers which, like telegraph and hop poles, posts and palings, *must* as a rule have their ends buried in the ground. It would be a hopeless task to attempt to enumerate even a fraction of the preventive measures that have at various times been recommended, many of them patented; and even were we to do so, the reader would find himself after their perusal in a hopeless state of bewilderment as to the particular merits of one over the other, especially as in some instances they are most contradictory. In evidence of this we will cite the two following diametrically opposite opinions, from a certain publication, concerning the proper way of erecting a simple post: 'Larch-posts will last much longer when driven with the thick end into the ground than otherwise. All wood lasts longer when placed in the position in which it grows than by reversing it; which seems to be quite natural, when we consider that, as the tree tapers upwards, the cells and tissues, or veins in which the sap moves, become smaller and less calculated to admit and convey external moisture than when the position of the tree is reversed.' 'W. Howe of Alleghany Co. relates an experiment made to test the comparative durability of posts set as they grew, or top end down. He says: "Sixteen years ago I set six pair of bar-posts all split out of the same white oak log. One pair I set butts down; another pair one butt down, the other top down; all the others top down. Four years ago, those set butt down were all rotted off, and had to be replaced. This summer I had occasion to reset those that were set top down: I found all sound enough to be reset. My experiments have convinced me that the best way is to set them tops down."

Unless we are sure that the wood be thoroughly well seasoned, it is far better to leave the part above ground naked, than to tar or otherwise paint it, for by so doing we close its pores and prevent all exhalation, which occasions fermentation, and brings on a premature state of decomposition. A rotten scaffold pole or putlog, although of fir and subjected to alternations of wet and dry, and handed down for several generations from father to son, is as rare a sight as a dead donkey. The timber introduced into the outsides of old houses, as in the ancient cities of Chester and Shrewsbury, which were never painted, and are now black with age, is a further striking illustration in favour of this truth. Ends that are to be buried should be first charred and then tarred, and this is the only treatment that will really and effectually prevent their decay by the rot. The charring dries up all the fungus-juices of the wood, and reduces the surface to somewhat the state of charcoal, the incorruptibility of which is attested by undoubted historical facts. The famous temple at Ephesus at its destruction was found to have been erected on piles that had been charred; and the charcoal discovered in Herculaneum after almost two thousand years was entire and undiminished; while little more than a couple of centuries since, some oak-stakes were found in the bed of the Thames in the very spot where Tacitus says the Britons fixed a number of such stakes to prevent the passage of Caesar's army, and these stakes, which were charred to a con-

siderable depth, had completely retained their form, and were firm at the heart. The additional application of coal-tar to the charred end while it is still hot forms, by means of the resin that is left behind after the acid and oils have evaporated, an air-tight and waterproof envelope. The preservative properties of creosote, which entirely prevent the absorption of the atmosphere under all conditions, and are noxious to every form of both animal and vegetable life, are without doubt superlative; but the high cost of the treatment—from fourpence to fivepence per cubic foot—debars its application except in works of considerable magnitude, or where, as in the case of railway sleepers, very large quantities of material are employed.

But there are other enemies, in the shape of insects, to fortify against, whose powers of destruction cannot be ignored; and here again we are confused by the thousand-and-one suggested remedies, of which the following has been proved really efficient. It is well known that kerosene is repellent to worms and insects; saturating the ends to be buried with this oil has proved a safeguard; the supply is kept up by boring a small hole in the post a few feet above ground, slanting down and reaching below the centre, which requires refilling about once in three years. Nearly every kind of oil is equally efficient. In tropical climes like India, the ravages of the white ant must be seen to be credited; the rapid extension of the little earthen mounds, similar to those thrown up by the mole, only about the size of half a cedar pencil, under cover of which they carry on the siege, is astounding, eating out the heart of the stoutest scantlings in a very short time. During the last Madras famine, enormous quantities of grain were stored in the goods-sheds of the Madras Railway, which in consequence had to be secured against the depredations of these pests. This, after many attempts, was at last successfully accomplished by picking up the floors to a depth of six inches and ramming in granite chippings—the white ant, and for that matter the black ant too, will not pass over any hard gritty substance—over which was laid the following mixture to form a surface: Tar, one part; soorkhee (pounded brick), one part; lime, one part; sand, one part—laid on hot and beaten; while the feet of the posts supporting the roof were surrounded with six inches deep of ashes, great care being taken that no clay or earth of any kind got mixed with them.

In the early days of submarine cables, Dr Russel wrote: 'As a mite would in all probability never have been seen but for the invention of cheese, so it may be that there is some undeveloped creation waiting, perdu, for the first piece of gutta-percha which comes down to arouse his faculty and fulfil his functions of life—a gutta-percha boring and eating *teredo*, who has been waiting for his meal since the beginning of the world.' He may be ranked as a prophet; for ten years after, the borer appeared in the *Limnoria terebrans*. And so it is with all building materials: iron has to contend against rust; lead against the solvent and corroding properties of water; brick and stone against climate and weather; wood, as has been shown, against the ravages of rot and insects; and it is only by making known the various preventives and antidotes discovered, that

the general public is able to derive the advantages which accrue from the investigations and experience of those engaged in any particular calling or profession.

A DUBIOUS COMPLIMENT.

BOISTE, a name familiar to philologists and grammarians, was a celebrated maker of dictionaries, at which he worked with an enthusiasm almost unrivalled in that department of labour, and with a degree of success which brought him both reputation and profit. The great Napoleon gave him the post of royal grammarian; and the hard-working student received this flattering testimony to his merit just as he was concluding his grand Dictionary of the French language. Very sweet were those concluding labours, and one may imagine the pleasure with which he corrected the last proof-sheets and complied with the customary form of sending complete copies to the censor of the press. Sweet also were his dreams that night, and the anticipations of the fame and the profit that should accrue to him from the publication of the elaborate work which in a few days would see the light. But, alas! never was the adage that speaks of 'the slip 'twixt the cup and the lip' more strikingly illustrated than in the case of poor M. Boiste. He had retired to rest one night after a pleasant evening with some literary friends, when, disturbed by a movement in his chamber, he woke up to find his bed surrounded by a posse of gendarmes.

'What is it, gentlemen?' said he. 'You have assuredly made some mistake. I am Monsieur Boiste, lately appointed grammarian to the Emperor.'

'Ah!' said the brigadier in command, 'the very man we want. See, sir; here is the order for the arrest of Monsieur Boiste, grammarian.'

The order was in due form, sure enough, and it was but vain to appeal against it. The poor scholar had to turn out and dress; and in a few minutes was seated with his captors in a close carriage, driving rapidly towards the castle of Vincennes.

Having arrived at the prison, the astonished captive was not without hopes that the obstinate silence with which all his inquiries had been met during the journey would no longer be maintained. He now urgently entreated to be informed of the reason for his arrest, at the same time protesting his entire innocence and his known devotion to the Emperor. The official at first paid no attention to his entreaties; but at length, out of respect it may be for the prisoner's gray hairs, condescended to refer to the order of arrest, and after perusing it, coolly answered: 'To secure the public safety.'

Poor Boiste was no wiser than before, but only the more perplexed. He was at once led off to a room fastened with an iron door and grimly grated windows, and there he was shut in, with the prospect of spending months, it might be years, in torturing his brain to discover how it could be that he, who had passed his whole life in the harmless avocation of arranging words in alphabetical order, could possibly have compromised the public safety. 'It cannot be,' he said to himself, 'that I am arrested on account of my book; for it was examined three several

times, was corrected and altered both by the chiefs and the subordinates of the imperial censorship, and everything to which they objected was struck out.'

It was little use spending his days in conjectures that led to nothing, and nothing was to be got by indulging in lamentations; so he began to exert himself. He drew up memorials containing the strongest appeals, and addressed them to all the persons of influence with whom he was acquainted, reminding them all that he had really committed no offence, and that he only required to know the charge against him that he might clear himself.

But week after week rolled away and not one of his letters was answered. At length one of the unfortunate prisoner's memorials fell into the hands of Fontanes, the head of the University of Paris, who knew the blameless character of the lexicographer, and had long held him in esteem. Fully convinced of the innocence of the man, who he knew had devoted a long life to the completion of dry and arduous labours, he watched for an opportunity of mentioning him to the Emperor. The great Napoleon happened to be in one of his gracious moods; he took from Fontanes the captive's written plea, read it over, and agreeing with him that there must be some mistake, summoned the Duke of Otranto to his presence and demanded an explanation.

The Duke knew no more of the matter than they did, and professed himself quite as much surprised at the arrest of Boiste as Boiste could have been to be arrested. True, there was his signature to the order; but then, as often happened, he had probably signed the paper when it was laid before him without reading it. He could give no explanation, and now in his turn he summoned the prefect. The prefect had no explanation to give, really knew nothing of the business, and he sent for his deputy. The deputy, after a search of some days, did contrive to rummage up the original of the fatal document. He hastened with it to the Tuileries, and then it was discovered that it had been drawn up upon the denunciation of the censor, who had actually accused Boiste of having characterised Buonaparte as a *Spoliateur*. The document afforded no information as to how, when, or where the offence was committed. The censor was immediately ordered to put in an appearance; but he happened to be three hundred miles off, engaged in his periodical tour of inspection and supervision of the provincial press.

'Let the prisoner himself be examined,' said Napoleon. 'It must be a blunder of some one's; for, not to mention that Boiste is incapable of such an act, it really would not be common-sense to insert calumnies in a dictionary.'

Next morning, Boiste was permitted to emerge from his prison, and was driven off to the Duke of Otranto's office, where he found M. Fontanes also awaiting him.

'Sir,' said the Duke, 'you are accused of libelling the august sovereign who rules over this mighty empire.'

'Me accused of a libel! I, my lord! Surely you cannot be serious? A libel comes from *libellus*, a little book—never made one in my life, sir.—Ask that gentleman, sir, the principal of our University; he will tell you that I know too

well the significations and the power of words, to'—

'But, nevertheless,' said M. Fontanes, showing him the accusation, but hiding the signature with his finger, 'read this.'

Boiste read it through as desired.

'Well?' cried Otranto, seeing the tranquil face quite unmoved.

'Is that all?' demanded Boiste.

'All!' said the Duke. 'Quite enough, I should think. I hope, for your sake, it is a mistake.'

'No mistake at all. It is the truth.'

'The truth!'

'Most certainly. I inserted it to do honour to the Emperor.'

'To do the Emperor honour!'

'Yes. To prove that he is as thorough a linguist as he is a warrior.'

'Sir,' said Fouché impatiently, 'we have no time for jesting, and you will find that this is no jesting matter.'

'I have no idea of jesting, I assure you; I should not dream of taking such a liberty with your Excellency.'

'Then be so good as to afford us some explanation.'

'Certainly; there is nothing more easy.' Then taking a copy of his new Dictionary, which lay on the table, he opened it, found the word *Spoliateur*, and pointed to the two words as they stood thus: '*Spoliateur*, *Buonaparte*.'

'And what,' exclaimed the indignant functionary, 'could have tempted you to such a foul libel as that?'

'Libel! I only gave His Majesty the honour that was due to him. I print his name after the word *Spoliateur* as the authority for its use. It was he who first made use of the word; he did so in the tribune, when he was General Buonaparte; he coined the word in the first instance, and it was never known in the French language until he gave it currency.'

The Duke looked at M. Fontanes, and M. Fontanes looked at the Duke, and both smiled in a rather subdued way at this simplest of all possible explanations. Boiste was immediately restored to liberty; but his artless attempt to do credit to the Emperor put him to no inconsiderable expense, as he was compelled to cancel the sheet that contained this very doubtful and certainly undesired honour to Napoleon, and print it anew for the entire edition. And indeed, considering the temper of the times, Boiste thought himself fortunate to get off so cheaply, especially as there were not wanting among his detractors those who did not scruple to insinuate that his professed tribute to the Emperor's genius as a linguist was designed for anything but a compliment.

STORY OF A WILD RABBIT.

A CORRESPONDENT writes: I have recently been reading, in some back numbers of your *Journal*, the articles by a lady, entitled 'Animals I have known and loved.' Amongst her many interesting and amusing descriptions of pets, there is no mention of a wild rabbit; and as we have never met anybody who has tamed one—people whom we have asked even saying that it cannot be done—perhaps our case is uncommon, and may be

interesting to some of your readers; for our rabbit would follow us, and eat out of our hands, and was as affectionate as a kitten. He was caught on the Downs when a few days old, and my mother undertook to try and rear him, allowing him to live for a time in her pocket, and feeding him constantly with milk from a teaspoon. He grew fast, and soon became quite friendly, being fed regularly on bran, fresh leaves, black oats, and any pieces that he could get given him; for he always knew the meal-hours, and would come and beg sweetly by the side of every one round the table. He lived loose about the room, only being put in a box when we were out. We were living in a 'flat' at the time, and he was never allowed downstairs, and no cat was ever allowed up.

Once he was missing for a long time, and we had given him up for lost, when he suddenly came scrambling down the chimney, none the worse, except for a little soot in his fur, as, luckily, no fire had been lighted. He would always come to the call of 'Bun, bun, bun!' and would jump on to our laps, and if allowed, would eat out of our plates. A favourite place for him to sit was on one of our shoulders, where he would sleep for hours, and sometimes gently nibble an ear!

We used to bring him home the red berries off brier-bushes; of these he was particularly fond, never, however, eating the seeds, but leaving them in neat little heaps on the ground. Loaf-sugar, too, he greatly relished—and when he saw it on the table, he would jump up, with the help of a chair or a lap, stand on his hind-paws, and look into the basin—and if the tongs were in his way, would take them in his mouth and lay them on the table, then look in again, take a piece of sugar, jump down with it, and crunch it up, and probably come back for more.

He took great delight in a cabinet in the room where he knew that cake was to be found, and would scratch at the door till he had opened it wide enough to get in; but soon learning that when he made a noise we heard him, and sent him away and locked the door, he took to doing it as quietly as a mouse; and more than once, thinking him unusually quiet and good, we have got up to see where he was, we have found him sitting in the cabinet greedily devouring cake!

He had a hundred pretty, clever ways; but much as we loved him, we were a good deal tried by him. His destructiveness was serious; boots and shoes or bags, if left unguarded, would be nibbled round in a very short time; and I remember well my mother's look of dismay on finding that he had eaten large holes in her petticoat, when she had only thought him asleep on her lap, under her dress for warmth.

We never left him alone for many minutes, as he was sure to be in mischief. Once, when we were going to be away all day, we gave him a large hamper and locked him in a room. When we came home and went to see him, he met us with great delight at the door, having eaten his way out of the hamper—his next amusement having been to scratch a huge hole in the carpet; but he was such a general favourite that even the landlady didn't object very much.

He was now about six months old; and as we were leaving the place, and could not take

him with us, much against our will we gave him away to some friends in town. His fate we have never heard—we have not liked to ask. We know that he was kept for some time; and we have heard of a visit to the store cupboard, where a quantity of scented soap and wax candles was found eaten or destroyed; and since then we have thought it better not to inquire, fearing to hear of a sad end, such as comes in one way or another to most pets.

We had a great love for this little rabbit, and I am sure he had for us; he certainly never seemed to pine for his natural wild life, but always appeared bright and happy. In memory of our affection for him, we feel sorry for his Australian cousins, who, however much they may deserve it, are having a very rough time just now, even without M. Pasteur's treatment coming into force. The interesting article on 'Rabbit Crusading in New Zealand,' in a recent issue of your *Journal*, proves that there at least the life of the wild rabbit is by no means all happiness.

YOU AND I.

We stood by the shining summer sea,
You and I;
And you whispered some old sweet words to me,
'Neath the opal sky.
Red sunset tints crept over the sand
As we lingered together, hand in hand,
Loth to part,
For 'the light that was never on sea or land'
Shone in each heart.

You sailed away o'er the silver sea,
You, not I;
And the tender message you left for me
Was: 'Love, good-bye!'
You traced that message upon the sand.
The proud cliffs towered on either hand,
Strong and sure;
And I said: 'Thus firm our love will stand,
And aye endure.'

So you in the busy haunts of men,
Far from the sea,
Took up the thread of your life again
Away from me.
The blossoms died in the woodland ways,
The roses dropped from their fading sprays
At my feet;
But I said: 'There will be golden days
When we meet.'

We stood once more by the shining sea,
You and I;
But you whispered no old sweet words to me
'Neath the cloudy sky.
The wind went sobbing along the sand;
I shivered, and felt no clasping hand.
We met to part;
And the shadows that deepened on sea and land
Fell o'er my heart.

THE ROUNDS OF THE PRESS.

It is quite common to read that a certain paragraph is 'going the rounds of the press.' Very few persons, however, think how extended those 'rounds' are, and consider how long it takes an item of news to go round them. Thanks to various associations and agencies, much news appears coincidentally in many papers; but for special articles and exclusive information, a different plan has to be adopted. In this country there is no copyright in news; and accordingly, long before most people are out of their beds, the London morning papers have been scanned through by London editors of provincial and American newspapers, and the cream has been carefully extracted and sent off by telegraph or submarine wire. As a result of this enterprise, readers in our great commercial centres are able to digest the substance of the political leading articles and the foreign correspondence of London papers at an early hour. English newspapers attribute much of this news to its rightful owners; but some of it appears in American newspapers as original matter. With the earlier editions of the metropolitan evening newspapers, a precisely similar operation is repeated, for the benefit of provincial sheets, except that their telegraphed extracts are mostly expressions of opinion on topics of current interest; and if it be true that the number of people who think for themselves is very small, this growing plan ought to be appreciated. A striking instance of what might be done in this direction was shown when Mr Gladstone introduced his Home Rule Bill. By previous arrangement, every morning newspaper in the United Kingdom published, only a few hours after the House of Commons rose, extracts from the leading articles of nearly all its contemporaries.

Although the system of telegraphing extracts is rarely resorted to except in the case of news, anything topical is not allowed to get stale before it is sent the rounds. Many of those gentlemen known as London correspondents, who are most

indefatigable snappers-up of unconsidered trifles, and who are wont to write so freely and carelessly of their acquaintance with cabinet ministers, make up their letters for weekly newspapers from paragraphs which have appeared in the 'society' newspapers. Whatever may be thought of the honesty of this proceeding, one thing is quite certain—that the letters are quite good enough for what is paid for them. The London letters of the provincial dailies are gathered together in a very different manner, and of course paid for on an altogether different scale.

Many paragraphs are passed from paper to paper by means of the scissors and paste-pot; this is more particularly the case with paragraphs of general interest, of which there are always a large number going the rounds. If this work be done intelligently and carefully, several columns of interesting reading matter can be gathered together with comparatively little trouble or expense. In most American newspaper offices there is a gentleman known as the 'exchange editor,' whose duty it is to look carefully through a number of papers and cull such extracts from them as are of general interest, or political information that is in accordance with the policy of his paper. But in England this work is usually done by the sub-editor or one of his assistants.

Any one in the habit of glancing through the principal American, Australian, and English newspapers must have noticed that there is a large number of miscellaneous paragraphs which have been steadily 'going the rounds' for years. Many of these paragraphs are kept out of the better class of newspapers; but the carelessly edited sheets pass them on, for, in most cases, the sole purpose of filling up a corner; and it seems probable that many years must elapse before they are given a decent burial. A wit once observed that he supposed sub-editors never heard or read any jokes, because they always 'scissored' a number of ancient witticisms, and passed by anything which was topical or presented in a new dress. The same observation

seems to hold good in the case of miscellaneous paragraphs; for extracts on such highly interesting and novel subjects as toads in stones, epitaphs, fat or tall men, and misers seem to have a peculiar and irresistible attraction for many sub-editors. In these days, it is no doubt difficult to meet with anything novel; but that there are many good paragraphs to be obtained is shown by the fact that certain widely circulated newspapers manage to get several columns of them every week.

Paragraphs are constantly being buried in the abyss of the past, and it is therefore only natural to consider whence the number is replenished. Thackeray, in one of his favourite 'bursts of confidence,' entreated the 'public newspapers which are in the habit of extracting portions of the various periodical works now published, not to reprint' the narrative of how Crawley and his wife lived without any income, of which discovery the great novelist very properly considered that he ought to have the benefit. How many editors and writers must arrive at a somewhat similar conclusion! Nowadays, some newspapers are filled with interesting quotations from books and magazines; and it is by these that most miscellaneous paragraphs are 'sent on the rounds.' If an author 'resuscitates' any curious fact or tells a good story, or if any part of his article lends itself to quotation, he may rest assured that in the course of his reading he will come across it again.

One instance of how articles and paragraphs travel about is worth quoting. About four years ago, a rather humorous article on 'Hand-shaking' appeared in one of the 'society' papers. Extracts from it, with and without the source acknowledged, were printed in certain English newspapers; and the whole of it was boldly appropriated by several American newspapers without any acknowledgment. In the course of time the article appeared in some of the Canadian and Australian newspapers, which, being more honest than their contemporaries, and thinking that the article was originally written for the paper in which they first saw it, attributed it to various newspapers of the Great Republic. After this, portions of the article were copied into English newspapers; and for a long time fragments of it travelled from paper to paper, and received slight introductory remarks from persons through whose hands they passed. The last remnant of the article that we have seen was introduced by a London newspaper as a 'characteristic example of American humour!' In all probability, every trace of this article will soon be lost; but many miscellaneous paragraphs, like the brook, 'go on for ever.' The *Pall Mall Gazette* once traced one of its 'Occasional Notes' through an extraordinary series of adventures, until at last its career was ended by its being embodied in a government Report. Another of its smartly written Notes, which, apropos of a strike in a certain industry, contained facts not generally known, was passed on by sub-editors long after the strike was settled—as careless a method of filling up space as that adopted in the newspaper office where Mark Twain served his apprenticeship. We had, says the great humorist, a quantity of 'deep philosophical stuff, which we judged nobody ever read; so we kept a "galley" of it standing, and kept on slapping the same old batches of it in, every now

and then, until it got dangerous.' It is a popular impression that many newspapers have a quantity of general matter which they use over and over again; but this is a delusion.

Lamartine predicted that in the course of time the daily press would be our only literature. At present, a man can keep pretty well in touch with what is going on in the world, and become acquainted with much solid literature, by reading his daily and weekly newspapers, for the simple reason that most newspapers quote largely from the magazines. But it is devoutly to be hoped that newspapers will never be the only means by which mankind can obtain advice on medical and hygienic subjects, unless more care, with a decent regard for consistency, is exercised. At present, all that some papers seem to trouble about is that two conflicting paragraphs shall not immediately follow each other; and, all things considered, those misguided persons who are wont to follow newspaper advice must frequently be somewhat puzzled. In turning over some files of newspapers, we read, for example, that night-air is injurious, and that to sleep with the window open is a great mistake. Two or three weeks afterwards there appears a paragraph in the same journal to the effect that 'heaviness' in the morning is caused by want of fresh air; and a little later we come across the solemn statement that to keep in good health every one should sleep with the bedroom window open. There is not a word of reference to the former paragraph. Many journalists can be numbered among dyspepsia's numerous martyrs, and as a 'fellow-feeling makes us wondrous kind,' they are very fond of publishing paragraphs on diet and dyspepsia. A collection of paragraphs on these subjects, culled from a widely circulated American newspaper, shows an endless diversity of opinion. Many of them start with the personal pronoun, instead of the delicious plural; but there is nothing to say who the author is. Having regard to the fact that doctors cannot agree, it is perhaps too much to expect anonymous newspaper paragraphs to do so; but one would think that reasonable care ought to be exercised that contradictory paragraphs should not appear within at least a month of each other, so that unfortunate sufferers who will follow newspaper advice should not have their faith in newspaper infallibility shaken by being warned against a system of cure, by their own adviser, too soon after they have commenced following it.

MR ESHOLT'S YOUNG WIFE.

A STORY IN TWELVE CHAPTERS.

CHAPTER V.

AGNES was now in a mood which caused her to feel that whatever might happen could not matter greatly. And yet she shuddered involuntarily when she called to mind all that going back to Tydd Street implied. But as regarded her aunt the case was altogether different. Up to the time of her brother's death, Miss Maria had been used to the comfortable affluence of middle-class life; and notwithstanding her high spirit and that reticence of speech which hid from others whatever cares might be consuming her, Agnes knew

how deeply she felt the change in their circumstances, and how the bitter tooth of poverty was gradually eating away the sweetness of her life. Moreover, she had been engaged for seven long years, but circumstances had hitherto been adverse to her marriage. Now, however, the chief barrier was removed. Since their arrival at Syringa Cottage, Mr Ludford had written to announce that he had received the offer of an incumbency the stipend of which was two hundred pounds a year. Modest as this income was, Agnes knew that both her aunt and Mr Ludford would look upon it as sufficient to allow of their embarking together on the sea of matrimony, so that now she, and she alone, stood in the way of their long-deferred happiness. Agnes knew her aunt sufficiently well to feel sure that she was too proud—with the pride of a poor gentlewoman—to burden her husband with the maintenance of her brother's child, still less would she leave that brother's child to battle alone with the world, not even if her marriage should have to be deferred indefinitely.

It was a hard strait for one so young to find herself placed in. Strive as she might, her heart still clung to her lost lover. What must she do? Where turn for comfort? Not many times had she need to ask herself that question. She went to the one who had been to her both mother and aunt in one, and kneeling by her side, opened her heart to her with many blushes and tears. Then it was that Miss Maria told the girl something about which she had hitherto kept silence—how she had seen Wilmot Burrell, in the company of two ladies, coming out of St George's Hall on the afternoon of the concert. There might be much in such a circumstance, or there might be nothing. Agnes listened with a chill at her heart; but when her aunt had ceased speaking, she said: 'After all, Wilmot must know a great number of people who are totally unknown to us. Probably the two ladies were some ordinary acquaintances whom he met at the concert, and to whom he was merely paying those little attentions which ladies look for under such circumstances.'

'Such might be the case undoubtedly,' answered Miss Maria. 'It proves, however, that he was in Liverpool at that time, and that he could scarcely have troubled himself greatly to find us out.'

'But how was he to know we were in Liverpool, aunt? If my letters never reached him, of which there seems some doubt, he would naturally write to the vicarage, in which case his letters would be returned by the post-office people.'

'Mr Burrell knew Mr Ludford's address,' said Miss Maria coldly. 'Had he chosen to write to him, any information he might ask for would have been furnished him at once.'

This was a state of the case which had never struck Agnes, but it was one which she could not gainsay. It was another stab to her love, which was slowly but surely bleeding to death.

Poor Miss Maria was at a loss in what terms to set about telling Mr Esholt that which she had promised Agnes she would tell him. The duty was a disagreeable one, but it must be got through somehow.

'Mr Esholt,' she began in a voice which was by no means so steady as usual, 'I must ask you to excuse my niece's absence this afternoon.

Feeling herself unequal to the interview, she has delegated me in her stead.'

Mr Esholt bowed gravely: he began to forebode what was coming.

'With reference to the offer you have made her, she wishes me to say how sincerely she thanks you for the honour you have done her; but that, while she respects and esteems you as much as it is possible to respect and esteem any one, she does not feel towards you that warmth of sentiment which would justify her in accepting your offer to make her your wife.'

'Give her time, Miss Granby—give her time. She may learn to like me better by-and-by. Time and opportunity often work wonders.'

'That is very true, Mr Esholt,' answered Miss Maria with a faint smile, which he took as a token of encouragement. 'Young people don't always know their own minds, not even when they think they know them best.—There is one circumstance,' she went on after a moment's silence, 'which, as matters now stand, I deem it only right that you should be made acquainted with. My niece has been engaged once already; but the change in our fortunes was the cause of a change in the young gentleman's feelings, and—— But there is no need for me to explain further.'

'He must have been a scoundrel, whoever he was,' said Mr Esholt emphatically. 'Your niece, madam, ought to think herself fortunate that she escaped becoming the wife of such a man.'

'We cannot expect girls in love to be philosophers, Mr Esholt.'

The merchant bent his brows for a few moments, then looking up with a frank smile, he said: 'What you have just told me, my dear Miss Granby, has been a great relief to me. So long as my only rival is the memory of her love for one who has proved himself utterly unworthy of it, I will not despair. I believe you to be my friend in this matter. Go to your niece, then, I entreat, and ask her permission for me to continue my visits as heretofore, if not as an accepted suitor, still less as a rejected one, but as one who, while never pressing his suit unduly, will still live, ay, and wait for years if need be, in the hope of one day winning her consent to become his wife.'

So Mr Esholt's visits went on as before, not at Syringa Cottage, however, but at the lodgings in Tydd Street, to which Miss Granby had insisted on their returning. Agnes was pleased to think that matters had been arranged as they had. Unknown to herself, she had come to trust in Mr Esholt so implicitly, to lean on him as a very tower of strength, that his absence would have left a void in her life far larger than she was aware of. He was so kind and patient, never speaking of his love, but betraying by a hundred little tokens how dear she was to him, that her feelings towards him began imperceptibly to assume a warmer tinge, so that, if he were unavoidably delayed and did not arrive at the expected time, she found herself longing and looking out for him and feeling his absence as a loss. Still, the sentiments with which she regarded him were very different from those she had felt for Wilmot Burrell.

Thus matters went on for some months longer, till one day Mr Esholt, deeming that the proper

moment had come, pressed his suit, and wrung from her a half-reluctant consent to become his wife. She felt relieved and thankful, now the matter was finally settled, but beyond that strangely indifferent. She did not care to think much about her approaching marriage; the prospect had few charms for her; but for all that she was glad—very glad, as she told herself, not once, but a thousand times—that it was to be so. She would do her best to make Mr Esholt a faithful and affectionate wife, while poor Mr Ludford would be made happy at last.

Mr Esholt and his sister lived in a large house on the heights of Everton, from the windows of which there was at that time a wide prospect across the Mersey to the villa-studded sandhills on the opposite shore. Mr Esholt's father had lived there before him; and the house was furnished in that massive but sombre style so prevalent in those days among the well-to-do middle classes. Everything in it seemed made to last a hundred years at the least. Thick Brussels carpets, considerably the worse for wear; heavy straight-backed chairs, that required both hands to lift them; a few oil-paintings, so dim with age that it was difficult to make out what they were supposed to represent; here and there an oval mirror in a tarnished frame; the windows shaded by red damask curtains, which hung in heavy folds from ceiling to floor, shutting out half the daylight, so that on the sunniest noon the rooms had a dull, twilight appearance—who that can go back in memory forty years does not recognise the kind of house, which even in these days is not wholly extinct! Such as it was, Mr Esholt had lived in it all his life, and no thought came to him that it was capable of improvement. Long habit and old associations had made it very dear to him.

It was a chill spring evening. Miss Esholt had reached home that day after an absence of several weeks. Dinner was just over, the curtains drawn and the lamp lighted. On one side the fire sat Mr Esholt, a decanter of wine at his elbow and the *Times* newspaper in his hands, which latter he was turning restlessly over, glancing at it here and there, but never appearing to read more than a paragraph at a time. This was so different from his usual steady adherence to one page before beginning another, that the attention of his sister was awakened thereby; besides which, the continual crackling of the crisp paper was a source of annoyance to her excitable nerves. She was seated in her own special easy-chair on the opposite side of the fire, her shoulders slightly raised, her head thrust forward a little, an elbow resting on either arm of the chair, slowly rubbing her thin transparent hands one within the other, while regarding her brother with a steadfast, unwavering gaze which seemed as if it would fain probe whatever secrets might perchance be locked up in his breast. She was wearing a dark-gray homespun dress, with small linen wristbands turned up towards her elbows; round her neck were a black ribbon and a plain white collar. She wore no jewelry or ornament of any kind: nothing could have been more simple and nun-like. Her long thin face was perfectly colourless, and bore evident traces of ill-health. Her black wavy hair was combed straight back from her forehead, after a fashion rather uncommon in those days, and

fastened in a heavy knot at the back of her head. She was probably about five-and-thirty years old.

Restlessly Mr Esholt continued to turn over his newspaper. It was quite evident to the observant eyes which noted his slightest movement that his thoughts were busy with far other subjects than those about which he was making-believe to read.

'Robert, you have something on your mind,' said Miss Esholt at length.

He gave a little start, and looked at her over his paper. 'I don't understand you, Janet,' he said in colder tones than he generally used when addressing his sister.

'You have something on your mind about which you want to tell me, only you don't seem to know how to set about it.'

Mr Esholt only coughed and raised his paper so that she could no longer see his face.

Nothing more was said for some time. At length Mr Esholt threw down the paper, filled himself another glass of wine, and then abruptly pushing back his chair, buried his hands in his pockets and began to pace slowly from one end of the room to the other, jingling his keys, and taking especial care to place his feet exactly in the centre of each square of the carpet as he did so. Miss Esholt, with a fan in one hand to shield her face from the fire, sat with an expectant air, as one who implied: 'I know you have something to say to me, and I can wait patiently till you have found out the best way of telling it.'

By-and-by Mr Esholt stopped abruptly in front of her. 'Janet, I am going to be married,' he said. He might as well have told his news at first, for any way of breaking it to his sister that he had been able to discover.

The fan stopped its restless fluttering, her teeth came sharply together, and she seemed to shrink visibly in her chair, as though struck by an unseen hand. There was silence while one might have counted six; then she said in her usual composed tones: 'Are you, brother? I hope you will be happy.'

'Thank you, Janet. I have little doubt on that score.'

'Handsome of course?' with the slightest shade of contempt in her voice.

'Lovable rather than handsome—at least that is how she strikes me. But I don't consider myself much of a judge in such matters.'

'Much younger than yourself?'

'Hum—well—yes. She will be of age in a few weeks, I believe.'

'And you, Robert—let me think—are five years older than I, and on my last birthday I was'—

'What can that matter, Janet?' he said a little sharply. 'You don't call me an old man, surely?'

'It is no concern of mine, of course. You are old enough to know your own mind, and have only yourself to please.'

'But I want to please you also, Janet. I want you and Agnes to know each other, and to love each other, as I am sure you cannot fail to do when you come together.'

A curious expression flitted across Miss Esholt's face. 'You are very kind,' she said in her iciest tones. 'But I am tired. Will you oblige me by ringing for Davvy?'

Mr Esholt bit his lip as he rang the bell. He knew that for the present the subject must be dropped; but at anyrate he had broken the ice.

Next minute, Davry entered. 'Up-stairs,' said Miss Esholt.

Her brother held the door open, and Davry, pushing behind the easy-chair, wheeled her mistress out of the room.

'Good-night, sister,' said Mr Esholt as he stooped to kiss her outside the door.

'Good-night, brother,' she replied; but he missed the smile which had never before been wanting when he bade her good-night. He went back into the room and sighed as he shut the door.

REMARKABLE DISORDERS OF SPEECH.

THE field of medical science, studded as it is with strange sights, exhibits nothing more curious than certain disorders of speech found in connection with brain disease. We do not refer to the ravings of the insane, or the hallucinations of the monomaniac, or the imperfect utterances of the congenital idiot, in all of which the thinking process is out of gear. Neither do we allude to cases of simple *mutism*, where the mechanism of articulation is fatally deranged. We refer rather to cases where there is almost unimpaired capacity for forming ideas, and also of pronouncing words, but with a strange inability to fit the word to the idea. To medical authorities this peculiarity is known as *Aphasia*, and it presents many features of great interest. In some of these cases the individual speaks with tolerable correctness, but slowly and laboriously, as if recalling the words with great effort. He seems to be speaking a foreign tongue, and to be obliged to dive deep into the recesses of memory before he can succeed in finding the desired phrase. Other aphasic patients speak in spasmodic jerks, pronouncing only one syllable at a time, much as the schoolboy scans his hexameters. Others, again, succeed with short sentences, but fail entirely on attempting longer ones. The most characteristic defect is where the sufferer, on being asked the name of an article, is speechless; but a moment afterwards, on the name being mentioned, he repeats it with intelligence, showing thereby that he both knows the word and can pronounce it, although immediately before he failed to do so. Thus, a conversation like the following may be carried on with an aphasic patient.

Holding up a pen, the questioner asks, 'What is this?'

The eyes of the patient show intelligence, his lips move spasmodically, but the required word will not come.

'Is it a sword?' asks the questioner.

The patient makes a gesture of impatience and contempt, clearly implying that the suggestion is ridiculously wide of the mark.

'Is it a pencil?' asks the questioner again.

The patient still shakes his head, but his look implies that this guess is much nearer the truth than the former one.

'Is it a pen?' is then asked.

'Yes—a pen,' answers the patient readily and with evident relief.

A moment afterwards the questioner again holds up the same object and demands its name;

but the patient is dumb as at first. He has just pronounced the word 'pen;' his whole demeanour shows clearly that he understands what it is, but by some inscrutable impediment he is hindered from connecting the idea with the word. Some link has dropped out of the mysterious chain which connects the thought formed in the brain with its articulate expression in speech.

Sometimes the tendency of the aphasic patient is to substitute for the correct words others resembling them either in sense or sound. 'Give me my little *chapel*,' said an aphasic patient once, when demanding his prayer-book. 'Are those the pipes for laying on the *light*?' was the mode of another's inquiry about the gas. 'My friend has become a Plymouth Brother' was what an aphasic once intended to say. What he *did* say was: 'My friend has become a Yarmouth Bloater!' In the two former cases the analogy in sense, in the last, the similarity in sound, explains the curious confusion.

An aphasic patient is sometimes in the position of a talking parrot, and possesses some half-dozen phrases which he employs inaccurately, and perhaps indifferently. To every question he may answer: 'Good-morning,' 'Quite ready,' 'Can't afford it,' 'List complete'—just as the parrot says 'Pretty Poll.' Sometimes he is limited to a few monosyllables, such as 'Yes,' 'No,' 'Nurse,' yet repeats the alphabet quite correctly, and may even say the Lord's Prayer without a slip. The explanation of this curious anomaly is that these last have become from long usage perfectly automatic, and are therefore readily repeated without conscious effort. Somewhat parallel to this is the case of the German long resident in England, who, on recovering from a brain attack, was found to have entirely lost his knowledge of English, while he retained unimpaired his command of his mother-tongue. The explanation is that we speak our native language quite automatically, but a foreign language with more or less conscious purpose and effort. The more automatic speech has become, the more is it likely to be left untouched in aphasia; while words or sentences demanding thought and deliberation suffer most. A patient who seems perfectly speechless will sometimes pronounce his name readily and audibly, if asked to do so in a peremptory tone of command. The nervous current flows readily along the well-worn channel, but fails to make its way by less familiar tracks.

In harmony with the principle already laid down, that, in Aphasia, automatic expressions escape the paralysis which overtakes voluntary and deliberate speech, we often find that patients who are unable to answer the simplest question retain unimpaired the power of swearing. The explanation is, that oaths are mere exclamations or interjections, uttered automatically and conveying no definite idea. The man who pronounces anathemas upon his tight boots or his tough beefsteak may be using conscious intelligent speech just as little as the snarling dog or the hissing snake. The *Donner und Blitzen* of the German is no more an intelligible appeal to atmospheric forces than the 'By Jove!' of the Englishman implies any conscious acknowledgment of Jupiter. The aphasic, therefore, retains the power of swearing because his oath is automatic, and not originated by any conscious idea. If he said to

himself, 'I will shock the doctor by profanity,' and tried to swear, he would be utterly unable to do so; yet a moment afterwards, under the influence of some sudden emotion, he might pour forth a profusion of oaths. Very strangely, yet in strict accordance with principles already enunciated, if the patient be asked to repeat one of the oaths which he has just uttered, he fails to do so. He cannot do voluntarily what he has just done automatically. This is the leading feature and the great mystery of Aphasia.

Sometimes an aphasic who has not spoken an articulate word for weeks will cry out quite intelligibly, under the influence of fear or surprise, just as an hysterical paralytic who had not moved a limb for many a day has been known to leap out of bed on hearing a cry of 'Fire!'

Occasionally, a patient who has lost all power of voluntary conversation can nevertheless read fluently and correctly from printed matter. The case is on record of an aphasic who kept a slate on which he wrote down all the common words and phrases which he was likely to need. When addressed, he referred to his slate, and if the vocabulary necessary for giving a correct answer was found written there, he replied readily and correctly, but was totally incapable of employing a single word which was not included upon his list. Here the explanation seems to be that the sense of sight helped the nervous impulses which were too weak to originate speech without this extraneous aid. A parallel to this curious condition is afforded by some patients who, on being asked to put out their tongue, are unable to do so, although their efforts show that they understand perfectly what is wanted. But if the doctor now puts out his own tongue, and repeats his command, they obey with perfect ease and readiness. Thus, the language of gesture gives the stimulus which articulate speech has lost the power of affording.

More frequently, the power of reading is more or less impaired *pari passu* with the power of speech. The patient pores over his book or paper with great apparent interest, but if questioned, he often exhibits an imperfect knowledge of its contents. Sometimes he picks out a word here and there, which he pronounces correctly and evidently understands; but he does not seem to grasp the drift of the whole passage. Very curiously, a patient may understand perfectly what is read to him, but stumble and blunder when he himself attempts to read. Here is a sort of reversion to the childish condition before the power of reading has been acquired.

Writing is usually more or less interfered with in the aphasic patient, and generally the degree of interference bears some proportion to the damage to speech. The aphasic may have lost entirely the power of writing, and make nothing but unmeaning strokes. He may form letters correctly, but be unable to group them into words. He may write down correctly his name and his residence; but there his capacity may end. He may write short monosyllables, but fail in attempting longer words. He may write single words correctly, but be unable to group them into sentences. Lastly, he may copy long passages from print with perfect correctness, and yet be totally unable to write a single word if the printed matter be withdrawn. A patient in this last condition may spell and pronounce correctly, yet be incapable of

writing a single letter unless written or printed matter be placed before him, when he copies with ease and accuracy.

Enough has been said to show the variety of symptoms present in aphasia and their truly marvellous character. The human body, like a complex and delicate instrument out of tune, may give rise to strange phenomena under the disturbing influence of disease, but none stranger or more impressive than those under consideration. These phenomena admit of a more or less probable theoretical explanation, based on our knowledge of the functions of that most complex and wonderful organ, the human brain; but this explanation requires for its thorough elucidation a familiarity with physiology which the general reader cannot be expected to possess.

Aphasic patients frequently present evidence of mental weakness, but they are rarely, if ever, actually insane or idiotic. Often their emotional nature seems deprived of its usual controlling force, and they laugh or cry with more than infantine readiness. The emotional sobriety of adult life seems to be lost in the return of the simplicity of childhood or the advent of premature senility. Sometimes the sufferer seems distressed by his futile efforts at speech, which he abandons with looks of disgust and despair. At other times he seems amused at his own non-success, and joins in the laugh which his ludicrous attempts draw irresistibly from the bystanders. The sense of his failure always strikes him forcibly, whether on its vexatious or its comical side. He seems anxious to give us the impression that he knows perfectly what he wants to say, and could say it, if some incomprehensible obstacle did not cruelly bar the way. The words are present in the brain, and the machinery of speech stands ready to evolve them, but somehow the usually ready wheels refuse to move.

Such cases frequently recover, sometimes completely, sometimes with the persistence of a little hesitancy or thickness of utterance. Others recover their intellectual faculties, but with this fatal *lacuna*—the memory of words is blotted out. Intellect is there, the organs of articulation are unimpaired, but the patient has forgotten his own language, and is reduced to the condition of the baby with its two or three imitative monosyllables. In some of these cases it has been found possible to teach the use of language again, and the man of forty or fifty goes back to his elementary spelling-book and laboriously re-acquires the language which he learnt at his mother's knee. It may be doubted if the field of human experience affords any more curious or more touching spectacle than this.

A FAMILY SECRET.

IN FOUR CHAPTERS.

CHAPTER II.—A STRANGE STORY.

DR AYNLEY had settled down in Yarmouth to cultivate a small practice he had bought into a large one, as he hoped; but it did not yet tax his strength overmuch. It was therefore little of a sacrifice for him to determine that the first visit of the day should be to the mill, although he would have been glad if it had involved some sacrifice.

On going down to breakfast, his pale worried look was instantly observed by his sister, who kept house for him. 'Good gracious, John!' she exclaimed, 'you look ill. What is the matter?'

'I am all right, Jane; but I have rather a peculiar case on hand.'

'A new one!' was the sister's response, delighted to think that he was making progress, but without the slightest consciousness of an uncharitable wish that people should get ill for the purpose.

'Yes; but we won't talk about it at present. —Another cup of tea, please, and I'm off.—By the way, what was the name of the man Dr Fairfax's daughter married?'

'What!—don't you know? He is Mr Chisholm, son of the Honourable Mrs Chisholm of Broadmarsh, who is, I am told, the most pompous old tyrant that ever was known. She rarely comes into Yarmouth, for she prefers to do all her shopping in Norwich, when she doesn't go to London. I have seen her often—a stout, frowsy-looking creature, with a puffy red face. She would be called horridly vulgar, if it were not for her carriage and flunkies.'

'You are certainly not complimentary to the lady,' said the brother, smiling at Jane's frank criticism of the head of one of 'the County Families.' Jane had a habit of speaking frankly as impulse dictated.

'I disliked her at first sight, when she was pointed out to me. I positively hated her when we were told that she made no end of a fuss about the marriage of her son to the daughter of a common provincial apothecary—that is what she called Dr Fairfax!'

'She must have a poor appreciation of our profession,' said Aynsley, amused by his sister's indignation, and thinking of Mina's possible trials with such a mother-in-law.

'She is an awful woman, I believe. They say that she badgered her husband into his grave long before his time, but after having induced him to leave all his fortune under her control. Maybe she will do the same for Mina. I have only seen her two or three times since the wedding, as she sat beside Mrs Chisholm in the carriage. She did not look happy, poor thing.'

He could stand no more. 'There, there, Jane —you have given me enough gossip and scandal for one meal. I cannot tell you when to expect me back, for everything will depend on what it may be necessary to do in this special case.'

He could not afford to keep a carriage of his own yet; but he had an arrangement with a livery-stable keeper by which he could obtain any kind of vehicle on reduced terms when required. A smart trap was now waiting for him at the door, and he was driven rapidly away in the direction of the mill. He was glad now that he had never before made inquiries about Mina and her position; for if even half of what Jane had told him and suggested were true, he would have been maddened and distracted out of all capacity for work by thinking of the torture the woman who was so precious in his eyes must be enduring. The experience of the previous night gave him good reason to believe that there was much more truth in what he had heard than there is usually in current gossip. She must have endured tor-

ment far beyond anything that scandal-loving minds could have invented before she could have been driven to attempt suicide.

Alighting at the door of the mill cottage, bustling Nan was out to meet him before his foot touched the ground. He saw at once by the smile on her good-natured face that she had no bad news for him. 'She have slept beautiful, sir, an' have just taken a cup o' tea; but she won't eat an' she won't speak,' was the report.

Joe was busy in the mill, and only for a moment appeared at the top of the long flight of white steps which led to the first floor, to shout 'Good-mornin', sir.'

The doctor found his patient quiet as he had been led to expect; but when he saw the large dark eyes still unnaturally bright and staring at the ceiling—felt how hot and dry the hand was, how quick yet feeble the pulse—he knew that she was by no means out of danger. To his professional inquiries she responded in monosyllables and in a weary lethargic manner. She seemed to have no interest in her own condition, and this absolute indifference was to him the worst sign of all.

Then came the really difficult part of his duty. He could not allow her to remain there without communicating if possible with her husband, now that he knew where to seek for him. And yet he did not like to do this without first informing Mina of his intention. He stood looking at her in sad silence for a few moments, uncertain how to begin; for he feared what might be the effect of telling her that he was about to make known her condition and whereabouts to the people from whom she had fled, and to escape whom she had even meditated self-destruction. At length he determined on his line of action.

'You do not recognise me, Mrs Chisholm,' he said softly.

She started at the sound of her name, gave him a quick scared glance, and shrank back in the bed. 'How do you know my name?' she asked huskily.

'I was a friend of your father's, and, years ago, a friend of yours too,' he answered; and being endowed with one of the most valuable gifts which those who attend the sick can possess—a pleasing voice—the sound and the words reassured her.

'My poor father! I am glad he has not lived to see this day,' she murmured and almost sobbed. Aynsley hoped that tears would come to her relief. They did not come yet, and she continued coldly: 'No; I do not recollect you.'

'I was with your father as his assistant for some time. My name is Aynsley.'

'John Aynsley?—I remember now. My father was very fond of you. But I thought you were drowned at sea three or four years ago.'

'Ah, then, you have never spoken to any of my sisters about me, or you would have learned that although shipwrecked in the *Hesperides*, I escaped with others.'

'I am glad of that,' she said simply.

'And I am glad too; and one of the reasons for being glad is that I am here to be of service, as I hope, to the daughter of the friend who was my guide and helper at a troublesome crisis in my

life. . . . Now, Mrs Chisholm, you know who I am, and you know you can trust me. I ask you for your own sake, and as your father's friend, to explain to me as far as you can the circumstances which have brought you into this position.'

He spoke earnestly, and Mina felt that she could give him her whole confidence. But she shuddered to think of what had passed, and was silent. She could not tell even her father's friend that the husband who should have protected her had, for his own selfish enjoyments, left her at the mercy of the woman who hated her and wished her dead—his mother.

'Will you not trust me, so that it may be in my power to help you?' Aynsley pleaded.

She still hesitated, although she was beginning to feel how precious was the sympathy of a true friend, and she realised that John Aynsley was one. Lying silent under his gaze, she recalled the days when he had been constantly in the house, and recalled, too, the often repeated regrets of her father that he had gone away.

'I can do nothing unless you tell me how this has come about, and I want to help you back to health and happiness,' Aynsley urged again.

She put out her hand and touched his gratefully. This was the first sign of emotion she had betrayed, and it gave him much satisfaction.

'I can tell you nothing more than this,' she began falteringly. 'Mr Chisholm's mother never liked me. He concealed from me and from my father how much she was opposed to our marriage. She was not at our wedding, but he told us that she was too ill to leave her room. When I went to Broadmarsh, I did not see her for several days. She was still in her room. When we did meet, she treated me as a stranger. Her cruelty began from that moment.'

'But did Mr Chisholm endeavour to bring about an understanding between you?'

'He did not comprehend or know what was going on,' she answered, still trying to shield the husband. 'He was much occupied in hunting, shooting, and—and with his friends, so that he was very little at home, and could not see or guess the petty tortures to which I was subjected.'

'Why did you not take your proper place as mistress of the household?' ejaculated Aynsley, his blood quickening with indignation.

She looked helplessly at him. 'You do not know the—the woman,' she said with a spasm of pain.

'I shall soon,' muttered he to himself.

'For a whole year her system of torture went on; but after my boy was born, she became worse—a thousand times worse—and I knew that she was trying to drive me mad—trying to drive me to death, and that she wished me dead.'

'Why did you not speak to your husband?' Aynsley repeated.

'He would, not listen to me. At the first sound of a complaint about his mother, he would leave the room—leave the house, and would not return perhaps for a week; and thus I was still more at her mercy than when he was in the house. So I held my tongue and suffered. My boy'—

At last tears came to relieve her parched eyes,

and she covered them with her hand. The doctor turned to the window and waited patiently till she should be able to resume. This was another good sign of the improvement which rest and the sense of security from her tormentor were effecting.

'He was strong, and oh!—so bright,' she went on by-and-by. 'I thought that I could endure anything, now that this treasure was given to me. I no longer heeded the frequent absence of my husband, for I was callous to anything Mrs Chisholm said or did. He throve, and day by day grew stronger. The housemaid told me that he was able to walk much sooner than children usually do. It was the housemaid who told me this, for the nurse had nothing but complaints to make about him, and I did not like her. I was proud, and, for the first time since I had entered that house, happy. But suddenly he sickened and—died.' She could not go on, and again there was silence in the little room.

'What was his illness?' inquired the doctor after an interval.

'I do not know. She said I killed him by over-indulgence, and my husband was away—not expected home for a month or more. The horror of the accusation made me think that death was my only friend. . . . Since then, all is confusion in my mind until I awakened here this morning.' She was exhausted, but evidently relieved by having told her sorrow to a sympathetic listener—one who had been her father's friend.

Aynsley had decided what he was to do: go to Broadmarsh, ascertain where Chisholm was to be found, and telegraph to him to return immediately. Then he would tell him that he must provide some fitting place for his wife, where, during her illness, she would be free from the terrorism his mother appeared to exercise over her—an influence which in her present condition would certainly prove fatal. An ugly task this—to tell a husband his duty; but he did not flinch from it.

He was, however, a little perplexed as to whether or not he should make his intention known to the wife. He concluded that it would be best not to tell her, lest, in her fear of the consequences, she might attempt to leave the cottage.

'I am going to take a great liberty, Mrs Chisholm,' he said quietly; 'I am going to act for you as nearly as may be in the way I think your father would have acted. I cannot do harm, and I may do good. Have I your permission?'

A grateful look was his answer.

'Then you will keep in bed; and Mrs Suffling will let you have everything you require. I will return in the afternoon to see what progress you are making.'

It was a decidedly bold step he was about to take—a step which under ordinary circumstances would have been inexcusable. But the circumstances were far from ordinary, and although he was no relative of the lady whose cause he espoused so warmly, her father had been his friend; whilst, as a medical man, he was bound to inform those who were her lawful guardians of the dangerous condition in which she lay,

and justified in calling on them to do their duty.

He told his man to drive to Broadmarsh, a distance of about four miles. On the way, his mind was busy going over and over again the details of the story of misery he had heard. He could understand such a woman as the Hon. Mrs Chisholm had been described to him to be, having strong objections to her son marrying any one except the lady she might have pleased to select for him. But the thing being done, he could not understand why or how the objection should develop into a fixed animosity which set in motion all the petty instruments of torture that are always at the command of the domestic tyrant. The cold look, the frown, the snappish answer, the sneer, the snarling jibe, the nagging reproach—these are poor weapons separately; but used in combination and continuously, they are potent as barbed arrows, driving the gentler-natured man or woman to madness and suicide.

Next, it was most strange that the birth of a male heir to the estate, instead of being a source of joy to the grandmother and softening her treatment of the mother, should have, as it appeared, intensified her animosity. The child died, and so far from attempting to console the bereaved mother, or of mercifully remaining silent, she had charged her with being the cause of his death. What could it mean?

Reviewing all the circumstances as they had been presented to him, John Aynsley came to the conclusion that either the Hon. Mrs Chisholm must be crazy, or must have some strong motive for desiring that there should not be an heir to the estate. Yet this seemed such an improbable idea, that he was more inclined to the alternative that there was some mental twist in the mother-in-law which would account for her extraordinary conduct.

Broadmarsh stood on a piece of slightly rising ground, which might almost be dignified with the title of an eminence, in view of the miles of perfectly flat land surrounding it. Along the edges of marsh-meadows there were, at varying intervals of fifty yards or so, stunted trees, all bending towards the west or south-west, as if running away with hair on end as fast as they could from the biting east and north-east winds. Skeleton windmills, used for pumping water in the process of drainage, rose like melancholy scarecrows dotted over the landscape. Bleak as they look when the sun is not shining, these meadows are rich in pasture, and produce much prime beef. The grounds of Broadmarsh House presented a pleasing contrast to the bare flat lands. They were dense with the foliage of trees and shrubbery, the result of cultivation during generations of the proprietors. The house was well sheltered from every wind that blew, and was scarcely visible from the main road.

As Aynsley was driven up the winding avenue, he observed that the blinds were drawn down, although the sun was not particularly strong. There was an uncomfortable silence about the place, as there is always when death is within doors. No sign of human or animal life manifested. When the trap stopped at the door, its arrival was not recognised by the appearance of any one. The bell was rung: it sounded hollow

and deep, as if the house were empty. A second summons, and after a few seconds the door was opened by an old man, who wore a white tie and a swallow-tail coat. This was the butler, Gedge.

'I wish to know if Mr Chisholm has returned yet, or if any message has been received from him?' said Aynsley, giving his card. 'My business is of the utmost importance and urgent.'

The man bowed in silence and retired. He did not ask the visitor to enter, but left the door open. He was absent long enough to make Aynsley feel somewhat impatient. He turned his back on the doorway and gazed at the well-kept lawn, the brilliant flower-beds, and the rich foliage of shrubbery and trees. The owners of such a home should have been happy. He was sure that Mina would have been so, if the malevolent influence of a foe on the hearth had not robbed her of all possibility of content.

Gedge returned so noiselessly that Aynsley was unaware of his approach until he spoke: 'Mr Chisholm has returned, sir; but he only arrived about an hour ago, and after a long journey he is too much fatigued to see any one. But the Honourable Mrs Chisholm will hear your business.'

'Did you give my message to Mr Chisholm himself?'

'All messages are first given to our mistress' (so, then, poor Mina was not even acknowledged as the mistress of her husband's house!), 'and she says Mr Chisholm is sleeping, and must not be disturbed on any account.—Come this way, please.'

Aynsley followed as requested, and hoped to find in the forthcoming interview some clue to the meaning of the curious events in which he had become so unexpectedly involved.

The room into which he was ushered was long, low, and narrow, with four windows overlooking the lawn. The closed blinds imparted a sombre aspect to the deep brown hangings and massive furniture of more than a century ago, and made a sort of twilight in the place, although it was not yet noon.

It was a few moments before his eyes became sufficiently accustomed to the subdued light to enable him to perceive a lady standing in front of a large armchair at a little distance from him. She was short and stout, as his sister had described her, but what her complexion and expression might be, he could not distinguish. He bowed; and with a slight inclination of the head, she spoke in a cold but not unpleasant voice: 'What has procured me the honour of your visit, sir?'

'Pardon me, madam,' he answered brusquely, for, prejudiced as he was already against her, his prejudice was increased by the manner of his reception, and he did not mean to stand on ceremony; 'I did not come to see you, but Mr Chisholm.'

'Any business you may have with my son can be equally well transacted with me. You say the matter is of importance?'

'Of the utmost importance.'

'Be seated.' She pointed to a chair, but he remained standing.

'Is it quite impossible for Mr Chisholm to speak to me even for a few minutes?'

'Quite impossible,' she answered implacably.

'He is greatly fatigued, and very much disturbed in mind by a domestic calamity which has befallen us. Your card shows me that you are a medical man, and you will therefore understand from my explanation why a stranger cannot be admitted to him at present.'

'It is in reference to this calamity that I have called, and I believe the interview would be beneficial to him.'

He observed that the Hon. Mrs Chisholm started slightly when he mentioned the object of his visit; but her voice was steady and cold as before. 'Do you mean that you have come here as a messenger from that shameful woman who has dishonoured her husband and his family?'

'Madam,' he said sternly, 'I was a friend of Mrs Chisholm's father: I knew her when she was a mere girl, and I know that she is incapable of any act that could be called dishonourable.'

'Oh, a friend of the Norwich apothecary!' she exclaimed with a short cough, expressive of contempt. 'Pray, are you a relative?'

In his impetuosity he fortunately overlooked the question. 'Dr Fairfax was a medical man of high repute in our county, and of that you must be perfectly aware. However, I did not come to talk of him, but of his daughter. Since you persist in refusing to allow me to speak to Mr Chisholm, I must tell you my errand. I do not come as a messenger, but of my own motive as a friend, to say that the lady is lying in a very precarious condition in a cottage where she found shelter late last night after having been frightened out of her own house.'

'Her house!'

'I believe this house belongs to her husband.'

'You are mistaken, sir. This house belongs to me during my lifetime'—said with an evident effort to control rising passion and speaking with a courtesy which the listener felt was insincere. 'You are also mistaken in fancying that she was frightened from her home. She eloped from the house with a man who has long pretended to be my son's friend. Is not that dishonour to her husband and his family?'

The calmness with which this statement was made contrasted so strongly with her brief ebullition of temper that Aynsley was taken aback for a moment. He quickly recovered his presence of mind, however, and detected in this daring assertion the bitter nature of the woman's enmity, so desperate that it destroyed all regard for truth. She was evidently ready to say or do anything that might help to ruin poor Mina in the estimation of her husband and the world. He felt cold with horror. He had heard of fiends appearing in the shape of women, but had never expected to meet one. He believed that he had now done so; but the malignity evinced in every word and look suggested that there must be a reason for it that was unknown to Mina and, perhaps, to Mina's husband.

He must find out what that reason was, and therefore restrained the outburst of indignant remonstrance which rose to his lips. 'If that be so,' he said, seeming bewildered and hesitating what to say, 'I can understand your anger with the lady. But are you certain that this is the case? Are you sure that she eloped with your son's friend?'

The Hon. Mrs Chisholm fancied that she had

vanquished him, and became a little more gracious. 'I see, sir, that you are not perversely blind. Oh, she had a most winning way with her, and, I believe, could blind any man who was not on his guard against her.'

'I assuredly had no suspicion that the affair would take a turn of this kind. It is quite different from what her statement led me to believe.—May I ask what proof you have that she is guilty?'

'You are a stranger to me, and you are her friend. But the whole scandal will doubtless become public in a few days, and I have no hesitation in at once showing you the character of the woman in whom you appear to take so much interest.' She went to a massive desk standing on a side-table and took from it an open letter. 'This,' she said, handing it to him, 'was found under the pillow in her bedroom yesterday morning after her shameful flight was discovered.—Read it.'

The contents were brief: '*My Darling—meet me at the usual place at the hour agreed upon, and we will be happy.—Your loving* HARRY.'

Despite his conviction that the whole thing was a piece of clever deception, Aynsley was perplexed by this note, said to have been found in Mina's bedroom. There was no date, no superscription, for the paper had been enclosed in an envelope which was not forthcoming. The words of the missive clearly implied a previous understanding between the correspondents.

'Pardon me two more questions. Who found this paper, and who is Harry?'

'The note was found by the nurse under the pillow when she went to make the bed: apparently it had been forgotten in the hurry of preparation for the elopement. The person who signs himself Harry is Mr Henry Blaxland of Ormesby Park.—Are you satisfied?'

'I am still puzzled. She did not elope with Mr Blaxland, or she could not have been found as she was late last night only a few miles from her home.'

'She no doubt missed the morning train by which I have ascertained Mr Blaxland started for London; and as she had forgotten her purse, she could not follow. He is of course waiting at Liverpool Street Station, in expectation of her arrival by every train. She has had her wickedness impressed upon her by that severest of all monitors, empty pockets, and so has repented. But she has taken her course. She is as guilty in my eyes as if she had gone with the man, and she shall never enter my house again.'

'I do not think she wishes to do so; but you are bound to see her provided for.'

'I shall do nothing.'

'Then her husband must.'

'He shall do nothing either, if I can prevent him.'

The vindictiveness of the woman was invincible to any arguments, and Aynsley was forced to play his trump card. His whole manner changed to one of stern rebuke. 'You compel me to the conviction,' he said, 'that it is not your belief in Mrs Chisholm's apparently meditated guilt which moves you to this inhuman conduct towards your son's wife, but your wish that she should be considered so.' He fancied that she started at this random shot, which, as he

discovered afterwards, was much nearer the mark than he could have imagined.

'Sir!' she exclaimed, bristling up with rage.

'There could have been no intention of elopement,' he went on calmly, 'or the poor lady would not be where she is, or in her present condition. Look at that note again. Whoever it was intended for is asked to meet the writer at the usual place. The railway station would scarcely be the usual place for clandestine meetings between your son's wife and his false friend.'

'On the contrary, I should say a most convenient place of rendezvous for them.' This opinion was confirmed with a jarring little laugh.

'I see that it is useless to attempt to alter your decision, which is based on your wish, and not on any common-sense view of the case. You must, however, be aware that if Mr Chisholm does not do his duty, the law can compel him to do it. If he believes himself wronged, he has his remedy.'

'And the disgrace of having to seek it,' she commented bitterly.

'That is for him to decide, when he learns the whole of the circumstances which have led to his wife's departure from this house. If you still refuse to spare Mrs Chisholm the humiliation of being indebted to strangers for the succour which she ought to have from her husband, I go straight from here to report to the chief-constable at Yarmouth all that has happened.'

'Where is she?' was the sullen inquiry.

'That information I reserve for Mr Chisholm or the police. I would have liked to spare her the scandal which will arise; but I am confident that she will win pity from every one; whilst the shame will fall upon you and your son for the cruelty of which she has been the victim.'

'Sir!—you are insolent.'

'Madam, good-morning.' He bowed low and quitted the house, thus depriving her of the satisfaction of ordering him out.

SOME OLD TAXES.

THE British taxpayer of the present generation is apt to indulge in a good deal of 'sweet self-pity' when he casts his mind's eye over the subscriptions he is called upon to make to the national exchequer. It may be interesting to some, therefore, to take a glance at the good old times, and learn what cause the taxpayer who lived at the end of the last century had for his complaints. It is hardly necessary to remind the reader that the time referred to was the stirring epoch of the naval war between Great Britain and France, when the resources of the country were strained to their utmost to meet the cost of our huge navy, and to carry out the numerous defensive precautions on our coasts against Bonaparte's threatened invasion. Every session of parliament saw the increase of old taxes or the imposition of new ones, some of which latter suggest that the government must have been at its wits' end to imagine what next to raise money upon.

The additions made to the statute book when George III. was king comprise amongst others,

'An Act for granting to His Majesty certain duties on licenses to be taken out by persons vending hats by retail, and also certain duties on hats sold under such licenses, and for laying additional duties on all hats and caps imported into this kingdom' (1796). With becoming solemnity, His Majesty's faithful Commons proceed to define how the impost upon his subjects' headgear was to be levied. All persons 'uttering or vending' hats by retail who resided 'within the cities of London and Westminster, or within the distance of the bills of mortality, or within the borough of Southwark, in the county of Surrey,' were to pay for the license a sum of forty shillings. Provincial retailers, who were evidently not regarded as a very flourishing class, might procure a license to utter hats for five shillings only. Every dealer thus licensed was to have the words 'Dealer in Hats by Retail' over the door of his shop, on pain of a fine of forty shillings for each hat sold; and to prevent mistakes, the Act declares that 'any dealer selling less than a dozen of hats to any one person at one time shall be deemed a retailer of hats.' The penalty for trading in these articles without a license was to be fifty pounds.

With graphic exactness of detail, the Act goes on to explain how 'paper tickets stamped with the several duties hereby imposed' might be obtained from the Commissioners of Stamps, and how they were to be 'pasted or affixed by the utterer in the lining or inside the crown of such hats,' under a penalty of ten pounds for each omission. All headgear, whether made of 'felt or wool or beaver or any leather or japanned hats,' were subject to the following scale of duty: For a hat whose value did not exceed 4s., duty 3d.; 7s., duty 6d.; 12s., duty 1s.; and for all hats whose value exceeded 12s., duty 2s. The latter was further required to make a 'separate and distinct charge for stamps' in his bill when submitting that document to his customer for payment. And if hatters of that date had anything in common with those of the present, we may be sure that this section of the Act was universally and carefully observed. It is hardly astonishing to find that such a tax as this was frequently evaded; and from the police reports in the newspapers it seems to have been not uncommon for the defendant in a case to turn the tables on the prosecutor by laying information against him for wearing an unstamped hat. The *Edinburgh Advertiser* of the 30th January 1798 records the following instance of this, which, as the editor remarks, is 'somewhat singular in its details.' The Rev. Charles Scott, chaplain of Portsmouth Dockyard, had prosecuted a working-man for carrying a gun through a coppice near his country-house at Furbrook, and had had him fined five pounds in conformity with the game laws. Mr Scott took off his hat in court, and injudiciously laid it on a chair within his victim's reach. He, smarting under the loss of his five pounds, examined the hat and found that its lining did not bear the prescribed stamp. He promptly laid an information, and receiving half the fine Mr Scott was ordered to pay, had thus the pleasure of reducing his own penalty out of his prosecutor's pocket. 'The court was uncommonly crowded,' adds the reporter, 'and no decision ever gave

greater satisfaction.' It is doubtful if Mr Scott shared in this feeling.

On another occasion a young farmer was summoned before a magistrate and fined for shooting a hare beyond the limits of his own estate, the two men who informed upon him being duly rewarded. The sagacious farmer, whilst in court, took advantage of an opportunity to examine the informers' hats; he found the stamps wanting, so told upon the owners, who were at once mulcted in sums amounting to nearly double that which they had received for bringing him up.

It is not stated that any special facilities were provided by thoughtful officials to enable contending parties in court to examine each other's hats, but from the number of cases reported, it was evidently a favourite mode of seeking to retaliate.

Men's hats made of straw were apparently unknown in Scotland until about May 1798, when the following advertisement appears in an Edinburgh paper: '*New Straw Hats*.—By His Majesty's Royal Letters Patent. Archibald Gibson has just got to hand, in addition to his present variety of New Things, a few beautiful Straw Hats in an entirely New Stile, and quite different from anything yet seen in this country.' The material of which hats in the 'New Stile' were made exempted them from duty, for in June of the same year the Act was extended to 'all hats, caps, and bonnets made of leather or other materials.' Nightcaps, by the way, were specially mentioned in the Act as being free from the operation of this curious tax.

Finally, it may be added that under the terrible laws of the day, any one forging or counterfeiting hat stamps, and being lawfully convicted of the offence, would be adjudged a felon, and thereby suffer death without benefit of clergy. This was of course merely an extension of the existent Act for the protection of His Majesty's stamp revenues; but the legal punishment for defrauding those revenues of a sum which in this case might not exceed threepence is a startling consideration at the present time. The Act under which this tax was levied was repealed in 1811.

Another tax which would create some sensation were a ministry to hint at it to-day was that upon clocks and watches (1797). It was enacted that 'Every clock or timekeeper, by whatever name the same shall be called, which shall be used for the purpose of a clock, and placed in or upon any dwelling-house or any office or building thereunto belonging, or any other building public or private,' shall be charged an annual duty of five shillings. Church and hospital clocks were exempted from payment. In respect to watches, a gold timekeeper—or more properly its case—was to bear a yearly duty of ten shillings; whilst those of silver or any other metal were to pay two shillings and sixpence. It does not appear that this tax was often evaded; watches were not of course in very general use at the time, and those who owned them were of the better class. It was, moreover, levied through the vendors of watches, whose stocks were readily accessible for examination, and as the duty was directed to be paid quarterly, such examinations would be equally frequent. This Act remained in force for one year only; and in his speech advocating its repeal, Mr Pitt explained that it had been

found to bear hardly upon an 'industrious, useful, and valuable class of men' in a manner the ministry had not anticipated. He estimated the annual return from the duty at two hundred thousand pounds, and proposed that the loss to the revenue should be compensated by some other means.

Watches were procurable at a moderate price in 1798, as shown by a watchmaker's advertisement. Mr John White of Edinburgh announces to the public that in consequence of the repeal of the Act, he is enabled to offer his assortment of watches of every description at prices ranging from two guineas to one hundred; 'well worth the money, having been laid in since the duty was taken off the cases.'

The tax upon hair-powder, which was levied in 1795, remained in force in its original form until so recently as 1869, when it yielded the modest sum of one thousand pounds per annum, against the two hundred thousand pounds which it had sometimes returned in previous years. Every person using or wearing powder was compelled by this Act to take out an annual certificate permitting him to do so at a yearly cost of one guinea. Certain exemptions were made: Subalterns, non-commissioned officers and men of any branch of His Majesty's regular land forces. Commanders, and all officers of a lower rank in the navy, were allowed the use of powder free of duty. All officers above the ranks specified were particularly cautioned that they were liable to the tax. Dissenting preachers whose incomes did not amount to one hundred pounds a year were exempted; and, as in the case of many similar enactments, the royal family and their immediate servants were specially absolved, as a mark of respect. The legislature had some regard for the paterfamilias whose quiver was full, for provision was made whereby a parent with more than two unmarried daughters could procure a double certificate, costing two guineas, which enabled all the young ladies of the family to indulge in the use of powder. The penalty for omitting to take out a certificate was twenty pounds; and the newspapers bear witness to the frequency of prosecutions for attempts to evade the duty, wherein the defendants were convicted on the evidence of informers and duly fined.

The income tax of the present time fades into insignificance when compared with that of 1798. The following are a few extracts from the graduated scale of rates. Only incomes under £60 a year were exempt. Exceeding £60 and below £65, one-hundred-and-twentieth part of the whole. Exceeding £70 and below £75, one-seventieth part of the whole. Exceeding £95 and below £100, one-forty-fifth part of the whole. These are not startling in their exorbitance, but the amount goes on in increasing ratio, until possessors of £200 a year or more were called upon to contribute no less than *one-tenth* of their means.

Mr Gladstone's eightpence in the pound in 1885, and even the heavy Crimean tax of fourteenspence, appear moderate beside the war taxes of Mr Pitt's administration; but we seem to have inherited our dislike to this particular impost from our grandfathers, who had such excellent reason for theirs.

A people labouring under such taxes might

perhaps consider themselves justified in regarding their compulsory support to the state sufficient to absolve them from further burdens. To such a pitch of enthusiasm and excitement, however, did popular feeling rise, under the repeated brilliant exploits of our vessels and the rumours of Bonaparte's intended invasion, that voluntary subscription lists for the defence of the empire were supported with a generosity which is the best evidence of the prevalent feeling. His Majesty King George subscribed £20,000, or one-third of the sum annually voted to the privy purse. Many noblemen gave yearly sums, to be continued for so long as the war should last. Prominent amongst these were the names of Lord Fitzwilliam for £10,000, and of Earl Carrington for £7000 a year. Every class was freely represented in the lists which appeared regularly in the papers. Regiments gave a whole week's pay; the working-men of collieries and manufactories vied with each other as to whose joint collections should be the largest. School-boys subscribed to send through their masters a mite for the national cause. The local branch funds were swelled by the half-crowns and shillings of domestic servants and farm labourers, whose knowledge of the object of their donations must have been of the very vaguest. In Scotland, money poured in with a freedom that in less than twelve months placed the enormous sum of £1,618,000 in the hands of government.

The old forgotten taxes referred to in this paper were of course small items in the grand total of our forefathers' burdens, and only deserve notice by reason of the nature of the articles upon which they were laid.

THE STORY OF A MILLIONAIRE'S GRAVE.

IN a former number of this *Journal* (June 17, 1876) was briefly told the story of the life and death of Alexander Turney Stewart, who, starting without special business training and with the modest capital of one thousand pounds, left behind him, at his death in April 1876, a fortune of six millions sterling—a fortune gained not by fraud or by speculation in the gambling sense, but by untiring industry, strict honesty, and an unwavering adherence to the grand principle of ready money, which Stewart was among the first to appreciate at its true value.

With most men, even millionaires, death closes the story. In Stewart's case it was not so; the most romantic chapter of his eventful history was yet to be told.

His place of burial was the graveyard of old St Mark's Church, situated between Tenth and Eleventh Streets, Second Avenue, New York; an unassuming place of sepulture, owing nothing to sculptured effigies or marble monuments, but noteworthy as the resting-place of Governor Peter Stuyvesant and other historic worthies. Here, beneath a plain marble slab, bearing the words 'No. 112. ALEX. T. STEWART, Family Vault,' was the burying-place of the Stewart family. It was already occupied by the bodies of Mr Stewart's

only two children, who had died in infancy, and of one or two relatives of Mrs Stewart. The vault was underground, with nearly three feet of earth above it. It was approached by a flight of steps, closed at the top by three stone slabs. These were covered with earth and the surface turfed over, so that nothing was ordinarily visible of the tomb save the marble slab already mentioned. Mr Stewart's body was enclosed in three coffins: an inner shell of oak, covered with rich black Lyons velvet; an intermediate covering of lead; and an outer coffin of red cedar. Attached to the lid of the innermost coffin was a massive silver plate, bearing an inscription as under:

ALEXANDER T. STEWART.

Born Oct. 12, 1803.

Died Apr. 10, 1876.

The last rites having been completed, the entrance to the vault was closed, the ground above was turfed over, and the marble slab replaced. And here the remains of the dead millionaire rested undisturbed for two years and a half. It was not, however, intended that this should be their final home. One of the latest of Mr Stewart's enterprises had been the development of a tract of land which he had purchased on Long Island, and which he proposed to transform into a model city, a town of bijou residences for the business men of New York. It was of considerable extent, being nearly ten miles in length and a mile in breadth. The whole site was in the first place laid out in streets and avenues, with pavements, sewers, and watercourses, all of the latest and most approved construction. Gas and water were laid on, and a railroad laid down for communication with New York. The ground having been thus prepared, Mr Stewart began to erect villa residences, each with an ample garden attached, and the work had made considerable progress at the time of his death. In this new township, known as Garden City, Mrs Stewart determined to erect a Cathedral to perpetuate her late husband's memory. The corner-stone was laid in June 1877, and the work was pushed rapidly on to completion. A special feature of the building was a splendid crypt, in shape a sixteen-sided polygon, twenty-two feet in diameter, and twenty feet in height. At the angles stood pillars of variegated marble with elaborately carved capitals, from which sprang the ribs of the groined roof, meeting in the centre. The space between the pillars was of white statuary marble, richly panelled and sculptured, the ceiling and tessellated floor being of the same material. This was intended to be Mr Stewart's final resting-place, and the remainder of the building was on a scale of equal magnificence. It was doubtless the knowledge of the erection of the Cathedral, and purpose for which it was intended, that prompted the daring deed we are about to chronicle. If Mrs Stewart had expended, as was currently reported, a million dollars to provide a mausoleum for her late husband's body, it was a not unreasonable inference that any one who could gain possession of the body itself might command a royal ransom for its restoration.

In the month of September 1878, the sexton of St Mark's Church received an anonymous

letter, warning him that an attempt was about to be made to steal Mr Stewart's remains. No great importance appears to have been attached to this communication; but on the morning of the 9th of October it was discovered that the stone over the grave had been disturbed during the night. It had evidently been shifted from its position and put back again; but the vault did not appear to have been opened or the grave otherwise disturbed. The discovery was communicated to Judge Hilton, Mr Stewart's executor, who caused new locks to be placed on the gates of the graveyard; and in order to mislead any future marauders, caused the gravestone to be shifted away from its proper position to a vacant spot some ten feet distant, carefully turfing over the place it had occupied. As a further precaution, the night watchman of some stables close by was instructed to visit the graveyard from hour to hour and to arrest any one who might attempt to gain an entrance.

Nearly four weeks elapsed. No further attempt had been made, and Judge Hilton, satisfied that the danger, if any, was past, dispensed with the services of the watchman. Three days later, the assistant sexton, Francis Parker, on entering the churchyard in the morning noticed a heap of fresh clay by the side of the grave, and going nearer, found that the vault had been broken into. He ran post-haste to fetch his chief, Mr Hamill, who resided close by; and the two, descending into the vault, found that the three coffins had been broken open and the body of Mr Stewart removed. The silver coffin-plate had been torn off; and a piece of velvet, in the form of an irregular triangle, had been cut from the covering of the inner coffin, and taken away. The removal of the gravestone did not seem to have caused any difficulty, for no other portion of the ground had been disturbed. It was inferred, from certain marks upon some of the posts surrounding the graveyard, that the thieves had drawn lines from point to point, the intersection of such lines indicating the precise spot under which the vault lay. The fact of their possessing such exact knowledge seemed so remarkable that suspicion not unnaturally fell upon the sextons, as being presumably the only persons who could have supplied the information. They were, however, both men of exemplary character, and were able to satisfy those concerned that they had no hand in the matter.

Judge Hilton lost no time in taking action. He at once placed the matter in the hands of the police, and the next morning a notice was issued as follows:

25,000 DOLLARS REWARD.—Whereas in the early morning of Nov. 7, 1878, the vault of the late Alexander T. Stewart, in St Mark's Churchyard, in this city, was broken into and his remains removed from thence: The above reward is offered, by direction of Mrs A. T. Stewart, and will be paid for the return of the body and information which will convict the parties who were engaged in the outrage. Or a liberal reward will be paid for information which will lead to either of these results.

HENRY HILTON.

This notice, however, produced no effect. Meanwhile, a theory was started by an expert in

criminal matters to the effect that the body had been in all probability removed at the date of the first disturbance of the grave, and that the second and greater disturbance was merely designed to call attention to its absence, and to provoke the offer of a reward for its restoration. He further maintained, basing his opinion on the height of the surrounding railings (nearly ten feet), and the fact that the gates had never been found unlocked, that the body was still in the graveyard, probably concealed in some other vault. The suggestion received due attention, and a careful search was made of the graveyard, many of the vaults being opened and examined, but without result.

The police being completely at fault, a new detective was brought on the scene in the shape of a bloodhound. Starting from the violated grave, the keen scent of the hound quickly traced the course of the robbers as far as one corner of the churchyard and a house abutting thereon. There were clear signs of some person with muddy feet having climbed up to the balcony of this house; and the theory of the police was, that the remains of the missing millionaire had been lifted over the railings at this point and on to the pavement below. Here, however, the trail was lost. It was thought by those in charge of the investigation that the two or three days which had elapsed since the outrage, and the many feet which had in the meantime passed along the street, sufficiently accounted for this. They may have been right; though it seems to us, surveying the case in cool blood from afar, that had we been the New York police, we should have wanted to know a good deal more about that corner house; and not the less so that the proprietress—said to be a highly respectable lady—repudiated the idea of her balcony having been made use of as suggested, and volunteered a statement—contradicted by the police—that street boys were in the habit of climbing there, and that the muddy footmarks probably arose from that cause. It is proverbially easy to be wise after the event, and it is possible that the experiment was actually tried, and that the dog was allowed a chance of regaining the trail from the level of that mud-besmeared balcony, but we find no record of it.

The police found in the graveyard a new dark-lantern, and a short-handled coal-shovel, which had apparently been used for digging up the earth. Their theory was, that the robbers had lain flat on the ground to do this, inasmuch as, there being no upright monuments which could afford the cover, any attempt to dig in the ordinary way must almost certainly have attracted attention. The vendor of the two articles above named was discovered, but he could give no information as to the buyer. There were found in addition, near the grave, a back number of the *New York Herald*, and an old stocking, on which muddy hands had been wiped. Up to two A.M. on the morning when the outrage was discovered there had been rain and sleet, and as the articles in question were dry, it seemed pretty clear that the crime must have been committed after that hour.

Here the police discoveries ended. The distress of Mrs Stewart, then in her seventy-sixth year, was very great, and she would willingly have offered a large reward for the mere recovery of

the body without any reference to the conviction of the offenders. This was doubtless the state of feeling which the robbers had calculated upon. But Judge Hilton took a different view. Sentiment, he held, must yield to principle in such a case. Simply to advertise a reward, 'No questions asked,' would be to offer a premium to similar outrages, and endanger the sanctity of every rich man's grave throughout the United States.

Mrs Stewart yielded. The offer of the reward remained in its original form; and the blackmailers began to perceive that if they were to make a profit of their crime, the first advance must come from themselves. Accordingly, in January of the following year, a certain General Patrick H. Jones, who, notwithstanding his high military title, was in fact a practising lawyer in New York, called at the headquarters of the police with a letter he had received from a gentleman signing himself Henry G. Romaine. The letter, which bore a Canadian postmark, stated that the remains of Mr Stewart would be delivered up on payment of the modest sum of two hundred thousand dollars, and enclosed a one hundred-dollar bill by way of retaining fee to General Jones, if he would undertake to act as go-between in the matter. As a proof that the writer was no mere impostor, but the true and original robber, the letter went on to give particulars, as follows:

'The remains were taken before twelve o'clock on the night of the 6th, and not at three o'clock on the morning of the 7th of November. They were not taken to any house near the graveyard' (Was this to divert attention from that 'eligible corner residence?'), 'but to me, near One Hundred and Sixtieth Street. They were then enclosed in a zinc-lined trunk and left on an early morning train. They went to Plattsburg, and from there to the Dominion. There they were buried. Except that the eyes have disappeared, the flesh is as firm and the features as natural as the day of the interment, and can therefore be instantly identified. The enclosed piece of paper is exactly the size of the piece of velvet taken from the coffin, while the small strip sent you will prove to be of the same piece as that on the coffin. If any additional proofs are required, the plate will be sent you upon inserting the following "personal" in the *New York Herald*: "Canada—Send P.—Counsel." If you decline to act, a friend will call for the retainer sent you. When you are satisfied that the relatives of Mrs Stewart will talk business, insert the following "personal" in the *New York Herald*: "Canada—Will do business.—Counsel." Then you will hear from me again.

HENRY G. ROMAINE.'

General Jones was too good a lawyer to 'decline to act.' He inserted the 'personal' calling for the coffin plate, which in due course came to hand, apparently from Boston, closely followed by a letter as under:

BOSTON, MASS., Jan. 31, 1879.

P. H. JONES, Counsel, New York City.

Immediately on arrival of *Herald* containing 'personal,' I decided to express the plate from this city, and thus avoid the discovery and publicity which would certainly follow the examination of the package by the Customs officials of the Dominion. Having satisfied the representatives

of Mrs Stewart of its genuineness, you will await further instructions, which will be forwarded after the insertion of the second 'personal': 'Canada—Will do business—Counsel.'

HENRY G. ROMAINE.

A second 'personal,' as indicated, was, by consent of Judge Hilton, inserted a few days later; and in due course came the further instructions to General Jones as to the terms on which alone the body would be restored. They ran as follows:

'1. The amount to be paid shall be 200,000 dollars. 2. The body will be delivered to yourself and Judge Hilton within twenty-five miles of the city of Montreal, and no other person shall be present. 3. The money to be placed in your hands or under your control until Judge Hilton is fully satisfied, when you will deliver it to my representative. 4. Both parties to maintain for ever an unbroken silence in regard to the transaction. These are the first, last, and only terms which will ever receive attention.

'Having communicated the contents of this letter to Judge Hilton, you will await his decision. You will inform me of that by a "personal" in the *Herald*: "Canada—Terms accepted." Until this appears, you will not hear from me again.'

Judge Hilton refused to agree to the terms proposed, but made an offer of 25,000 dollars. 'Henry G. Romaine' declined to accept it; and so matters stood for two years, after which the robbers made a fresh attempt at negotiation, this time with Mrs Stewart personally, without the intervention of Judge Hilton. General Jones still represented the blackmailers, who had by this time apparently become less confident of success, for they now only demanded the modest sum of 100,000 dollars, instead of 200,000 dollars, as at first. Mrs Stewart, worn out by grief and anxiety, and careless of cost so long as the object was effected, would have paid this exorbitant amount; but her representatives drove a better bargain for her, and the blackmailers at last agreed to return the body for 20,000 dollars, being a tithe of their original demand.

In making terms, however, they took good care to provide for their own safety. Everything was to be trusted to their 'honour.' The sum agreed upon was to be placed in charge of a single messenger, who was to leave New York City at ten P.M. in a one-horse buggy and drive along a lonely road—marked on a map which the robbers kindly furnished for his guidance—into an adjoining county. If he was accompanied or followed by detectives, his journey would be in vain; but if good faith was observed, he would be met at some point of the road indicated by a representative of the blackmailers, and from him receive instructions as to his further proceedings.

It was an unpleasant and might be a dangerous errand; but a young nephew of Mrs Stewart pluckily volunteered for the uncomfortable mission. He started as arranged, and drove on and on in the direction indicated by the map. At three A.M. a man wearing a mask rode up to him, gave him a sign which had been agreed upon, and directed him to turn off from the high-road at a particular point. He did so; and after travelling some distance further, found another vehicle, not

unlike his own, apparently in waiting for him. Two other masked men descended from it, bringing forward a heavy bag. Passwords were exchanged, and the needful proof of identity produced in the shape of the triangular piece of black velvet cut from the coffin lid, which the messenger compared, and found to tally with the paper pattern in his own possession.

The agreed ransom was handed over. The mortal remains of the deceased millionaire were lifted on to the buggy of Mrs Stewart's representative, and he started on his homeward journey. Twenty-four hours later, his gruesome burden was transferred at dead of night, and with a privacy in singular contrast to the pomp and circumstance of its first burial, to its permanent resting-place in the crypt of the Cathedral. The wandering bones found rest at last, never, it is hoped, to be again disturbed. Any such disturbance would indeed be hazardous, for the remains now lie in the silent guardianship of Science. If any modern ghoul should once more attempt to violate their resting-place, an electric current will flash an instant message to the tower above, and the bells will sound a tocsin such as shall rouse the heaviest sleeper from his slumbers, and call every man in Garden City to lay hands upon the rash invader.

EXTENDED APPLICATION OF REFUSE OIL FOR INDUSTRIAL HEATING PURPOSES.

Some time since (No. 107) we drew the attention of our readers to the Lucigen Light, which has been largely adopted at the Forth Bridge works, and pointed out the advantages for lighting purposes accruing from the employment of the crude oil distilled from the waste gases of the blast furnaces. A new adaptation of this method of dealing with crude oil has been recently introduced with such success as to merit the attention of all who are interested in industrial advancement.

The rivet-heating furnaces at the Forth Bridge to which we refer are similar in principle to the Lucigen, though differing in details of construction. The former is designed to yield the maximum heating efficiency of the oil; the latter, to utilise to the best advantage the illuminating properties possessed by it. When it is stated that some eight million rivets will be employed in the Forth Bridge, no surprise will be felt that every effort has been made to secure a mode of heating them at once economical and effective, and necessitating only the adoption of such apparatus and plant as are readily constructed, and easily transported from point to point, so as to follow the work.

The furnace designed to meet these requirements is as follows: A circular galvanised iron tank, having a capacity of about fifteen gallons, in which the oil is stored, this quantity being sufficient to heat the furnace four or five hours; and the furnace proper, which is rectangular in plan, rounded at one end, and built of thin iron plates lined with fireclay, and fitted with a chimney of requisite dimensions. The whole is mounted on stout legs. A slightly arched roof divides the furnace into an upper and a lower compartment, communicating with each other at one end. In the lower compartment the rivets to be heated

are placed, through small sliding doors; whilst through the upper compartment is drawn the air, the quantity being regulated by dampers, necessary for the combustion of the oil-jet, and which becomes heated in its passage over the roof of the lower chamber. The oil, drawn from the tank already indicated, is introduced into the circular end of the furnace in the form of a fine spray by means of a jet of air having a pressure of twenty pounds per square inch, the combination between air and oil being effected in a specially designed burner not unlike the well-known injector for feeding boilers. This spray, as in the case of the Lucigen, readily ignites, and yields an excellent flame for heating the rivets, more cleanly, economically, and speedily than that obtained in coal rivet-furnaces. So successful has this mode of heating been found, that it is now employed at the Forth Bridge works for heating angle bars, &c., in preference to smiths' forges.

The rapid extension of the Lucigen Light and the adaptation of oil to rivet-heating have, amongst other causes, resulted in a rise in the price of this article, formerly regarded as little else than a waste product. Notwithstanding this fact, however, considerable economy is derived from its employment in comparison with coal, in addition to the other advantages enumerated.

A LETTER.

AND so, my child, your heart is almost weary,
And life has nothing that is fair to you?
Because, you say, with exclamation dreary,
'There is so little that a girl can do!'

And yet, I think, that somewhere in your city
Many there are who need a helping hand;
Or, at the least, some word of love and pity,
That they will prize, and subtly understand.

Be not cast down because of earthly treasure:
Little you have in silver and in gold:
These, too, are good; but God hath greater pleasure
In the heart's riches, which are manifold.

Do what you can, and let the Lord's increasing
Make of it more until the harvest come;
And meanwhile, strive and labour without ceasing,
Hearing Christ's voice above the city's hum.

Never a day within the crowded city,
Never an hour from morning until eve,
But that His Voice is heard to plead for pity,
But that His Heart is known to plain and grieve.

Go, then. But if your heart is sad and broken,
And to be helpless is your heaven-sent fate,
Take comfort, and remember, 'tis well spoken
That they, too, serve who only stand and wait!

POETRY AS A FACTOR IN EDUCATION.

PLATO thought that boys are the most untamable of wild beasts; and his opinion has had eminent supporters. Pope probably meant much the same thing when he said that schoolboys have no character. In view of this opinion, the story of Fénelon and the young Duke of Burgundy has a peculiar significance. There is, indeed, no more signal example of the immense importance of well-conceived, well-directed methods of education than the transformation which Fénelon wrought in his royal pupil. A more intractable subject probably never exercised the wits and the patience of his instructor. Before he was placed in the hands of Fénelon, the Duke was in simple truth much more of a wild beast than a rational human being. One of his chief pleasures was in kicking and biting all his attendants who approached him. At times he refused to speak a word for hours. On other occasions he would not eat, though tempted with all the triumphs of the royal cooks. His grandfather, Louis XIV., had been at infinite pains to obtain for him the most judicious attendants and tutors; but all had given up their charge as hopeless. At length Fénelon was called in. Fénelon was not without experience in dealing with young people, and he had already written a book on Education; but his peculiar fitness for the task he had undertaken was that of a character unique in charm and sympathetic insight. It is unnecessary to speak here of the marvellous skill and delicacy with which he wrought on the young Duke's nature, and how he so completely transformed him that Michelet even expresses a doubt whether in the transformation the strongest springs in the boy's character had not been broken.

In Fénelon's dealings with his pupil he had one leading idea, to which, perhaps, educationists have not given the importance it deserves. This idea was, that for every individual there is one poet who above all others appeals to the deepest instincts of his nature, and is therefore fitted

to be one of the highest forces in educating the best qualities of his mind and heart. Fénelon had not been long with his pupil before he discovered that with all his ungovernable passions he had a 'Virgilian soul'—in other words, that in the depths of the boy's nature there was that which responded to the grace and tenderness which distinguish Virgil above all other poets. Virgil accordingly was made the instrument through whom he sought to effect his ends. The result exceeded his hopes. Virgil did indeed become the Duke's favourite poet, and the chief formative influence of his brief life.

It is admitted that education at school and college as it is in these days realised is directed not so much to the formation of character as to the communication of knowledge. It is perhaps impossible that it should be otherwise. The needs of society must determine its educational code. In ancient Persia, to ride, to draw the bow, and to speak the truth, was all that the conditions of his mature life demanded of a youth. In modern England a boy is maimed in the race of life if he has not made some acquaintance with the 'circle of the sciences.' It follows from this that poetry, since it does not supply facts that can be of any practical use in life, receives but a subordinate place in our scheme of studies. All men of science would not express themselves so harshly as Newton when he said that poetry is 'but ingenious trifling;' yet there is undoubtedly a feeling abroad that when we compare him with the worker in any department of science, the poet is after all but a frivolous personage. If we have any doubt that such is the general conviction, we have but to reflect how most people would regard such a passage as this from Wordsworth. 'It is an awful truth,' he says, 'that there neither is nor can be any genuine enjoyment of poetry among nineteen out of twenty of those persons who live or wish to live in the broad light of the world—among those who either are, or are striving to make themselves people of consideration in society. This

is a truth, and an awful one, because to be incapable of a feeling for poetry in my sense of the word is to be without love of human nature or reverence for God.' Such a conception of poetry as is conveyed in these words would certainly appear to many people as in the highest degree strained and fantastic; yet it is the fact that the greatest of the world's thinkers from Aristotle to Stuart Mill have been of Wordsworth's opinion.

It was one of England's greatest lawyers who said that the wisdom of a country is to be searched for in its poets; and it was Aristotle's opinion that poetry deals with the highest forms of truth and conveys it most impressively. The production of poetry is certainly no trifling matter for the poet himself. There is, indeed, no form of mental exercise that puts such a strain on the whole man. Goethe, who is remarkable among poets for his self-control, declared that to write more than one tragedy a year would kill him; and Scott, who prided himself on his stoical self-repression, says in an interesting passage: 'I will avoid any occupation so laborious and agitating as poetry must be to be worth anything.' As far, therefore, as the expenditure of intellectual and emotional force is concerned, poetry demands as serious consideration as the most abstruse of the sciences.

The question has often been discussed whether or not the tendency of civilisation is to benumb the higher imaginative faculties. However this may be, it is at least certain that the influence of the poet of necessity diminishes as the interests of society grow more complex. In the simpler states of men the bard is, next to the chief, the most important personage in the nation. As poetry is almost universally the earliest form of literature, he is at once the historian, the law-giver, the prophet of the race. He originates public opinion, and he makes the tradition that gives birth to national sentiment. Even at comparatively late periods of a nation's development, it is extraordinary what a power the poet still wields over the minds of men. During the middle ages the words of the *trouvères* and the *troubadours* determined the ideals and formed the temper of the choice spirits of the time. When the revival of letters came, and the birth of the scientific spirit followed, it was no longer possible that imaginative literature could fill the place in men's minds it had hitherto done. Their thoughts were directed into a thousand other channels, calling into play other mental faculties, which gradually overthrew the paramount rule of the imagination. In this relation Sir Philip Sidney's delightful treatise, *The Defense of Poesie*, acquires a peculiar interest. Sidney was the last and noblest of the knights; and his passionate plea for the high function of the poet is but the expression of the sentiment of chivalry towards its *trouvères* and its *troubadours*. What poetry had been in the past to men of action, he conceived that it might still be in the future. It cannot be owing to the disappearance of poetical genius from the world that his hope has not been fulfilled, as we have had Milton and Wordsworth and Shelley since his day. The truth must therefore be that the poet has simply been jostled from his

high pedestal, and is now but one of a thousand other intellectual forces.

In one respect, indeed, the poet is as greatly honoured as ever he has been. It is frankly acknowledged by men of science of the best type that poetry is the highest expression of the human mind, and that the poet himself is the finest and rarest product of nature. Analysis has done its utmost in the way of explaining to us the genius of the poet and the essence of his work, yet both still remain the same incalculable elements that have bewildered and enchanted the mind of man from the beginning. The poet thus, even in those days of the all-pervading lights of science, sings like Wordsworth's lark in a 'privacy of glorious light.' Nevertheless, the reputed question of the senior wrangler regarding *Paradise Lost*, 'But what does it prove?' is doubtless the genuine expression of the general attitude towards poetry in the present day.

As has been said, it is idle to think that poetry can ever have that place in public instruction it once legitimately held. The conditions of modern life have made this impossible. An Athenian boy might have leisure to commit the twenty-four books of the *Iliad*; but though the discipline would doubtless be an excellent one, it would hardly be wise that the schoolboy of to-day should achieve the rival feat of committing *Paradise Lost* or the *Excursion*. Still, if we but keep before us the idea of Fénelon, poetry, even in the present condition of things, might surely be made a far more efficient instrument in education than it actually is. It has often been pointed out of late that as it is at present taught in our schools poetry is simply tortured into a fitting subject for examination. Poems are chosen for reading not so much because they are of a kind to appeal to the feelings and experience of childhood, but because they afford excellent material for an examination paper. What, for example, could be more absurd than to place *Paradise Regained* in the hands of pupils of fifteen or sixteen? That poem, the enjoyment of which, according to a high authority, is the last reward of consummated scholarship, is, in truth, of all poems in the world the best fitted to engender in a boy a life-long disgust for every form of poetic production. Short poems judiciously chosen and taught from the point of view of Fénelon would certainly go far to counterbalance that deadening of the emotional side of our nature which Darwin so sincerely regretted in his own case as the result of exclusively realistic studies.

But after all, if Fénelon's notion be correct, it lies with each to make the most fruitful application of it for himself. Thoroughly to master one poet and enter into his spirit is in any case a finer discipline than the cursory reading of a thousand. This is, indeed, the counsel of all the great masters of knowledge. Historians have been careful to tell us that they never really understood history till they had thoroughly mastered one period; and it used to be the earnest advice of an eminent Professor of philosophy to his students, that in his department the wisest course to follow was first to understand completely one great teacher.

An interesting question here suggests itself: Is it not the function of music to effect for the highly civilised societies of to-day what poetry

effected for the simpler societies of the past? It is undoubtedly the fact that music in its highest development is as peculiarly the art of the last three centuries as architecture was the art of the middle ages. It might seem to follow, therefore, that in music we should find the natural compensation against the excess of the scientific spirit. But great as are the achievements of modern music, it cannot be seriously maintained that it touches the springs of human conduct in the same degree as poetry. Music is, in truth, the 'least intellectual of all the arts,' and cannot, therefore, in the very nature of things, compete with poetry in influencing men's views of life and shaping the general course of their actions.

MR ESHOLT'S YOUNG WIFE.

A STORY IN TWELVE CHAPTERS.

CHAPTER VI.

DAVRY wheeled her mistress to the other end of the corridor, where was a recess in which stood what looked like a large wicker-chair without a seat. Davry pushed the easy-chair inside the wicker one, dropped a thin iron bar in front to keep it in its place, and then touching a spring, the chair and its occupant ascended slowly and smoothly to the level of the floor on the story above, and there became stationary. Davry having ascended by way of the staircase, removed the bar, and then pushed the chair before her into Miss Esholt's room.

Owing to an accident during childhood, Miss Esholt was unable to walk more than a few halting steps at a time, and altogether incapable of getting up or down stairs, though any one who only saw her sitting calm and upright in her chair would never have suspected it. No one, not even her brother, had ever heard her give utterance to a word of complaint. She was fond of travel, and, thanks to railways and steamboats, was able to get about from place to place as she pleased. It was her nurse, Davry's mother, who, by letting her fall when a child, had been the cause of Miss Esholt's lameness; and Davry had looked upon it as a sacred duty ever since to devote her life to the service of Miss Esholt and make reparation, as far as in her lay, for her mother's carelessness. She was a woman of few words, as simple as a child, her life bound round by the silver cord of duty. Davry heeded not the frivolous changes in the world's fashions, but still dressed her gaunt person as she had been wont to do thirty years before in her native village. She wore a striped linsey-woolsey petticoat; a loose print bodice, that reached a little below her waist; a white muslin kerchief, pinned high up her throat; and on her head a muslin cap, starched to an exceeding stiffness, the border of which, tortured into shape by the Italian iron, formed an appropriate scrollwork round her rugged time-worn face. If Miss Esholt was cold by nature, Davry was stony. She was like a woman who had been for years under the influence of a dripping-well, and had come back into the world partially petrified and unable wholly to regain her lost humanity. All the affection she was capable of feeling was centred in her mistress.

The room in which Miss Esholt now was was sacred to herself and Davry. With the rare exception of Mr Esholt, no one else ever set foot in it. It was library, boudoir, and sitting-room in one, and nowhere was Miss Esholt's extreme simplicity of taste more observable. The whole place, in fact, would have reminded a stranger of a business man's office more than of anything else. Miss Esholt was wealthy, and as she cared little for money, she could afford to be, and was very charitable; but her charity was always done by proxy. She subscribed liberally to all sorts and conditions of hospitals and institutions; but as for relieving any individual case of distress which might be brought under her notice, she would have considered such a proceeding as most ill-advised, and as tending rather to the moral deterioration than the physical well-being of the recipient.

Davry wheeled her mistress's chair near the fire and then waited for further orders. Miss Esholt sat for a long time without speaking, staring intently into the glowing embers: Davry stood behind her chair, immovable as a statue.

At length Miss Esholt spoke: 'Davry, he is going to get married.'

'Who's going to get married, Miss Janet?'

'Who? My brother.'

For a little space the ticking of the clock on the mantelpiece was the only sound. Davry was the first to speak.

'Then we may pack up our traps as soon as we like,' she said. 'We shan't be wanted here. Two mistresses in one house? No; that will never do.' She spoke in that tone of respectful familiarity which in days now gone used to make old domestics seem as if they were really a part of the family.

'A young thing like her to be mistress here!' said Miss Esholt with a contemptuous curl of her thin lips. 'No! his doll, his plaything, she may be, but not mistress of this house.'

'Young, is she, Miss Janet? All the worse for us, then. And pretty too, I make no doubt.'

'Pretty? Ay! My brother is no stronger-minded than other men. It's pink cheeks and bright eyes against the world with all of them.'

'We must find another home, Miss Janet,' reassured Davry in her positive way.

'Not so. No stranger shall drive me out of the house where I was born, and in which my father and mother lived and died.—Davry, I think I will go to bed.'

As soon as her mistress was in bed, Davry placed a reading-lamp on a small table by her side together with a number of books, and then, according to custom, respectfully pressed her hand and withdrew for the night.

Miss Esholt, left alone, set to work to read herself to sleep; but to-night she found the task anything but an easy one. Her thoughts would dwell on the revelation made her by her brother. She frowned, clenched her fingers, and fixed her eyes intently on her book; but by the time she had read a score of lines the words began to run one into another, and the page grew blurred before her. So she put out the lamp, and lay watching a thin shaft of moonlight that streamed in below the blind. 'O Robert, Robert!' she murmured, 'was not my love sufficient, that you must bring a

stranger into the house, who will come between us, and fling her shadow over us, and day by day push us farther apart, till at last we shall almost forget that we are the children of one mother !' Tears stood in her eyes ; but with a gesture of contempt at her weakness, she shut her lids tightly and pressed them back to their springs, and with that the bitter feeling at her heart grew still more bitter.

Mr and Mrs Esholt had been married three months. Miss Granby was also married to the curate of the faithful heart—a curate no longer, but a full-fledged incumbent with a living somewhere in the south of England.

Miss Esholt had gone to stay with some friends in London a few weeks before the marriage, and had only lately come back. She had had no wish to meet her brother and his bride in the first flush of their married happiness ; consequently, she was somewhat agreeably surprised when she found their demeanour towards each other so different from what she had expected it to be—so quiet, so commonplace, so undemonstrative. But her observant eyes soon discovered, or believed they did, the secret which lay at the bottom of this state of affairs, and the discovery only served to deepen her growing dislike to the young wife. That Robert, the best of men and dearest of brothers, the gift of whose hand and heart would have been an honour to any woman, should not be loved by her he had stooped to make his wife ! Such a possibility seemed scarcely conceivable, yet there before her was the fact, plainly observable to such as had eyes to see. Her brother's deep silent love, so unobtrusive, so delicately displayed that a stranger might have been excused for failing to notice it ; Agnes's strange caprices—for such they seemed to Miss Esholt—her long fits of coldness, of dumbness almost, and apparent indifference to everything around her, alternating with short bursts of summer-like warmth, when her whole being seemed to sun itself in her husband's love—nothing of this was unnoted by her. She saw that Agnes did not feel for her husband that deep, abiding love which, as she rightly conceived, a wife ought to feel ; but she did not understand that those very alternations which seemed to her so erratic and incomprehensible were the natural results of an affection newly born, timidly striving to put forth one shoot after another, till, by-and-by, if no untimely frost should intervene, leaves would begin to unfold themselves, and then the tender sapling would gradually grow and spread into a stately tree which no tempest would have power to uproot. Of all this Miss Esholt comprehended nothing. Her love for him gave her some gift of insight into her brother's heart, but she had no such gift in the case of Agnes.

She speedily discovered another reason for adding to the feeling with which she already began to regard the young wife. She saw that Agnes pitied her, and was full of compassion for her helplessness. This touched her pride bitterly. But she said nothing, but watched—watched incessantly, as though Agnes had some secret design on her brother's life, which it was her sisterly duty to frustrate.

Mr Esholt, reaching home each day between five and six o'clock, passed his evenings like a dutiful husband in the company of his wife and

sister, except on those few occasions when he and Agnes went to a concert or theatre together. Having dined, he would chat a little, skim the newspaper, ask Agnes to play, or to read to him half a canto of *Childe Harold*—his one favourite poem ; or sometimes he would doze a little—allowable after a busy day 'down town' and a good dinner—till eleven o'clock came, and with it the hour for retiring ; for Mr Esholt was as punctual in this as in everything else. Those long evenings tried Agnes greatly, for whether she were reading or working, or talking to her husband, Miss Esholt's cold glittering eyes were invariably fixed upon her. She felt them rather than saw them, and they discomposed her exceedingly. The love for her husband that was silently budding like a spring flower in her heart, drooped, frost-bitten and withered, in presence of that impassive, pale-faced woman, sitting propped up with cushions in her easy-chair. If, when together of an evening, she sometimes placed her hand with love's sweet familiarity in that of her husband, she felt Miss Esholt's stony gaze fixed on her with double power, and like the coward she was, she withdrew it in an instant and locked herself up again in her reserve.

Was Mr Esholt aware in his own mind of the strange undercurrents at work beneath the seeming quietude of his domestic life ? If so, he went on from day to day like one totally ignorant of their existence, and made no sign. But he was a man whom it was given to few to read or comprehend, and it may be that he saw more of the silent warfare that was being waged under his roof than either his wife or his sister had any conception of.

Summer was now here ; and when Mr Esholt one day told his wife that he had arranged for their removal to New Brighton in the course of the following week, a glad light sprang to her eyes, which he did not fail to take note of. They were not, however, going to stay at Syringa Cottage—that would be reserved for the use of Miss Esholt and such friends as she might have to visit her ; but at The Hollies, a small villa no great distance away. This was still better news for Agnes. She would not only get away for a time from the dull, heavy, sombre Everton House, but would be to some extent relieved from Miss Esholt's constant silent supervision, which began to weigh upon her more and more—a moral incubus from which there seemed no prospect of relief—but which, she sometimes felt, would in the course of time drive her to do something desperate. Now, however, she seemed to breathe again. For a little while the burden would be lightened, if not altogether removed.

Agnes felt happier and more light-hearted than she had felt for many a day, when she found herself installed in the charming little villa which Mr Esholt had rented for the season. Every morning after breakfast she walked with her husband to the landing-stage, where he took the quarter-to-nine steamer for Liverpool. After seeing him off she and Fido, her big Newfoundland, would go for a long ramble on the sands, here, there, anywhere—what did it matter where, so long as she was in the fresh air and sunshine and away from the sinister influence of those two black unwinking eyes and that white passionless face ! After luncheon, it was pleasant to sit in

the shade of the veranda, a novel in her hand, and Fido stretched out at her feet, with the great shimmering seascape basking far and wide before her, ploughed by a hundred ships and steamers inward or outward bound—a picture pregnant with suggestions and countless dramatic possibilities to the fresh vivid imagination of the girl who sat watching it by the hour together through her dreamy drooping lids.

Between five and six o'clock she and Fido would stroll down to the landing-stage again, this time to meet Mr Esholt on his return from business. Then would follow a quiet tête-à-tête dinner, after which it generally happened either that they made their way to Syringa Cottage, or that Miss Esholt and the two friends who were staying with her came to spend the evening at The Hollies. With two ladies there to break up the usual family trio, one of whom played and sang charmingly, Agnes felt that she could afford to treat Miss Esholt's silent hostility with a certain amount of disdain. The cold watchful eyes still followed her as heretofore, and seemed to note her every word and movement, as though for the purpose of recording them in some secret diary of the brain; but so long as she was in the presence of any one other than her husband, the spell which at other times was upon her seemed to lose half its force and meaning.

There came a day when Miss Esholt's friends took their departure; but as one or two others were presently coming to fill their place, the matter seemed to Agnes one of little moment. Miss Esholt came to The Hollies to dinner the first day after her friends had left, for Robert would not hear of her dining alone. Dinner was over, and they had gone back to the drawing-room—it was one of those evenings that would not admit of their going outdoors—when Mr Esholt said rather abruptly and apropos to nothing that had gone before: 'By-the-by, Agnes, I have a little surprise in store for you. You remember a young man of the name of Wilmot Burrell, I daresay?'

The sudden mention of that name which, now that she was married, she would fain have forgotten for ever, seemed to drive the blood in a sudden rush to the young wife's heart, and in a moment she turned white to her lips. She felt rather than saw Miss Esholt's lynx-like eyes full upon her. Mr Esholt saw nothing; he was cutting the pages of a new number of *Blackwood* and skimming a paragraph here and there as he did so.

There was a brief pause, which to Agnes seemed far longer than it really was. Then nerving herself by a supreme effort, she said in low clear tones: 'Oh yes; I used to know Wilmot very well indeed. His father and papa were old and dear friends, and Wilmot used to spend most of his holidays at the vicarage.'

'Then you will doubtless be pleased to see him again. It will bring old times and recollections to your memory. I have asked him to dine with us to-morrow.'

At these words, a tremor shot through Agnes from head to foot. Her heart seemed to stop beating for a moment, as if to gather the meaning of what had been said, and then hurried on in a wild tumult. She turned abruptly to the window. Fortunately, Mr Esholt had found

something in the magazine that interested him and seemed to expect no answer.

Miss Esholt rubbed her transparent hands one within the other. 'There is some secret here,' she murmured to herself—'some love secret, most likely—some little romance of the past which madam has not forgotten, maybe does not want to forget. I must be here to-morrow at the meeting of the two.'

THE CHAPEL OF THE PYX.

In the eastern cloister of the abbey of Westminster there is an antique door, admitting to a remarkable vaulted chamber, built during the time of Edward the Confessor, and known as the Chapel of the Pyx. It is called a chapel probably from the fact of there being at the eastern end the remains of a stone altar, and also a *piscina* close by. If tradition may be accepted, here lie the bones of Hugolin, treasurer to Edward the Confessor, the progenitor of our Chancellors of the Exchequer. The chamber is built in two bays, with a column in the centre, from which springs the vaulting. The aspect is gloomy and prison-like, the heavily barred window not tending to diminish that effect. Although part of the abbey buildings, this is government property, for when we stand within its walls we are in the first Treasury of the English nation, and where, in mediæval days, the hoarded wealth of royalty was kept under the eye and ecclesiastical guardianship of the abbot and monks of Westminster. Here, up to the time of the Reformation, the regalia of the Saxon monarchy, the Black Rood of St Margaret from Scotland (the Holy Cross of Holyrood), the Cross of St Neot from Wales, and all the later acquisitions of subsequent monarchs, were deposited. Large sums of money, chiefly for purposes of conquest, accumulated here, the money wrested from Jew or citizen helping to swell the amount.

The close connection with the religious house of Westminster, and the sacred character of the chamber, presumably consecrated its contents in the eyes of the people, for no very strict watch or guard seems to have been exercised. The cloisters of the monastery were the playground and place of relaxation of the monks, and here probably the lay friends would be admitted. Many would therefore know of the place and its contents. To break open and rob such a treasure-house would be treason and sacrilege; the latter in those days was punishable with death without benefit of clergy—a terrible sentence even when human life was held cheaply; but added to this, no sanctuary could be claimed by the sacrilegious. The chapel being hedged round with such pains and penalties, was not troubled by the mediæval burglar until early in the fourteenth century.

In the year 1303, Edward I. was commencing, or rather renewing war with the Scots, a war of revenge for defeats suffered at their hands recently, and for incursions made to the south of the Border. In this new campaign, a great land-force was raised and despatched north, and a numerous fleet sailed for the same destination. The Scots were to be crushed and their country

ravaged. Fortune favoured the English, and the hardy northerners retired on every side before the three divisions of Edward's army. At the height of the victory, and while the king was at Linlithgow, news reached him that the treasury in the abbey of Westminster had been forced and rifled of the vast sum laid up there for carrying on the war. The lords of His Majesty's suite must have had a bad quarter of an hour with the king after he learned this; for to lose a sum of £100,000, intended for the purpose of a sweet revenge, must have been gall to the ambitious monarch, stopping, as it must, some of his schemes of conquest. Such an outrage on the royal property had never before been committed, and accordingly strong measures were taken. The abbot and monks of the abbey were hurried off to the Tower; and a trial, which continued for nearly two years, was commenced. The chronicler and good friend of the monastery repudiates the assertion that any of the monks were engaged in the work of spoliation; but the chapter of Westminster being entrusted with the safety of the treasure, naturally was accused of connivance with the robbery. The tribunal before whom the brethren were taken released the greater number, but condemned the subprior and the sacrist; and they paid the penalty of the crime.

The history of the sacrilegious theft seems to have been, that one Richard de Podlicote audaciously robbed the refectory of the abbey, and in the course of his search for plunder noticed the insecure state of the treasury, and discovered the nature of its contents. In concert with some lay friends and some of the clerical guardians, amongst them the subprior and sacrist, a plot was elaborated for carrying off the money intended for furnishing the king with the means of war. Early in the year 1303 this plot was carried to a successful issue, and the money abstracted without at once causing attention. The plunder was not immediately removed from the precincts of the abbey, but buried in the green enclosed by the cloister. To prevent the removal of the earth being noticed, a crop of hemp was sown, partly, perhaps, to mark the spot, and also because of its rapid growth. The gardener who usually trimmed the grass was refused admission on various pretexts, the culprits fearing his scythe might strike something richer than the earth. As soon as the matter could be arranged, the money was exhumed, and conveyed across the river to the Surrey shore, concealed in two large black panniers, and from that time was lost. Where it went, no one but those concerned knew, or who profited in the possession of so vast a sum. The monk Alexander of Pershore, who carried it over, returned to his place in the abbey, and waited with the others the bursting of the inevitable storm. In consequence of rumour, or to draw out further sums, the king's officers soon after the removal came to the treasury; and what confusion met their eyes—broken boxes, jewels lying about broadcast, papers and seals strewn the floor, the whole of the contents upset, and, to crown all, the treasure gone!

The subprior and sacrist were executed; and to mark the enormity of the offence, tradition avers the bodies were flayed—let us hope after death—and the skin nailed to the door of the chapel as a warning to those who might be sacrilegiously

minded. There is no doubting that human skin was attached to the doors, for portions were submitted to a celebrated surgeon during the restoration of the abbey, and he pronounced them human. Whether the skin once covered the unfortunate subprior and sacrist remains doubtful, as some think the owners were certain Danes who troubled English peace for a time.

After the steed was stolen, the stable door was locked; double doors were put up and five or six locks added for security. Iron bars were fixed to the windows, and the chamber reduced in size by a thick wall built across it.

After the Reformation, the regalia were removed to the Tower, where they can now be seen under the guardianship of stalwart beefeaters in their quaint costumes, or the more prosaic blue-coated police. The 'relics' were probably converted into mundane coin by the reforming spirit of the time.

The name pyx is derived from the box or case in which are deposited the coins, specimens of the coinage of the realm, called trial pieces. Once in every five years certain officers, appointed by the Chancellor of the Exchequer and the Lord Chancellor, and constituting a jury, visited the chapel, whose doors with the numerous locks were opened by attendants bearing mighty keys. The duties of the jury were to inquire into the purity and weight of the coinage by assay and weighing, and give a written verdict testifying their satisfaction with the work of the Master of the Mint. On arriving in the chapel, the coins were taken out of the pyx, placed in paper parcels, sealed, and taken possession of by the jury. Coins were selected at hazard for testing by fire and scales; and after these operations, and in the afternoon of the same day, the verdict, written out at length, was handed to the Lord Chancellor. The document became a state paper, and probably the curious-minded may see them in the Record Office, or wherever such papers are deposited.

A FAMILY SECRET.

IN FOUR CHAPTERS.

CHAPTER III.—WHAT IS THE SECRET?

RAGE and chagrin held entire sway over the passionate mind of the Hon. Mrs Chisholm when the door closed behind Aynsley. Rage at being rebuked in her own house by a person like this young doctor for her treatment of Mina; and chagrin because she had not only failed to win him to her way of thinking, but had betrayed the real nature of her feelings towards George Chisholm's wife. Still the man must not be allowed to carry his tale to the police until she had time to consider what was to be done to accomplish her own purposes. She touched the bell, and Gedge entered.

'Go after that'—person, she was going to say, but succeeded in using the politer designation—'gentleman. Follow till you overtake him. Say that I have changed my mind, and particularly wish him to return for a few minutes. Tell him it is most important for the object he has in view.'

The Hon. Mrs Elizabeth Chisholm, née Bal-

hooley, was the eldest of eight daughters of an impoverished Irish nobleman who maintained the dignity of his ancestors by spending every penny he could get by borrowing on mortgages or from his friends, or by selling land outright. When he had money, he kept open house, and high revels were held in Castle Blaney. But the intervals between the revels became longer and longer, and at length they ceased altogether, for the master of Castle Blaney no longer had money, credit, or anything to mortgage or sell. But before the last feast he called his daughters together. 'Now girls,' said he, 'you must marry or starve, for after this ball, unless some unexpected bit of luck turns up, we won't have a farthing to bless ourselves with for two years at anyrate.'

The Hon. Elizabeth Balhooley was thus early made acquainted with the inconveniences of chronic impecuniosity; and her character was a curious compound of worldly prudence—often to the extent of niggardliness—and ambitious extravagance. She would do anything to sustain the glories of her royal race—for of course the Balhooleys were descendants of the kings of somewhere—and then she would pinch and practise all sorts of petty economies in order to balance accounts.

One of the guests at this last revel was George Chisholm, the wealthy English squire of Broadmarsh. He was middle-aged, and not intellectually brilliant, but thoroughly good-natured. The Hon. Elizabeth pounced upon him and claimed him for her own as soon as she had obtained satisfactory information as to the extent of his possessions. In her youth she had been slim and, some people thought, pretty, although she developed into a dowdy, whose figure could not be made dignified or remotely graceful by any art of dressmakers and milliners.

She secured her prize. The generous Squire made handsome settlements upon her, and they were married. The whole thing was accomplished in six weeks; and the rapidity with which the Hon. Elizabeth secured her prize astounded as well as amused outsiders. The newly married couple went to the Continent, announcing that their absence would be prolonged. At the end of ten months it was proclaimed in the *Times* and other journals that the Hon. Mrs Chisholm had given birth in Paris to a son and heir. About two years afterwards, the family returned to Broadmarsh, young George being declared by everybody to be a wonderful child for his age.

From the day of arrival at Broadmarsh till the date of his death, three years afterwards, the Squire's quiet country home was a perfect Bedlam to him—always filled with the maiden sisters, on whose account the Hon. Mrs Chisholm kept up a constant round of picnics and garden-parties in summer, dinners and dances in winter—revels in the good old style of Castle Blaney.

Before the Squire finally closed his eyes upon this giddy scene, three of the maidens had found suitable husbands, and had been married in the parish church at Sandybeach. The remaining four were subsequently disposed of to advantage by the clever scheming sister. Then that lady thought she might give some attention to the training of her son. The boy early displayed many idiosyncrasies similar to those of his

maternal grandfather. He was genial, fond of company, reckless in his sports, careless in regard to money, and left the whole management of affairs in his mother's hands. He got what he required—latterly, not always without sharp remonstrance—and he was content. The remonstrance had no effect. In his second term at Cambridge he was rusticated on account of sundry wild exploits; but he was a hero in the hunting-field, and the most notable 'gentleman rider' in the county steeplechases. His mother did not often attempt to interfere with him in anything he chose to do; and when she did so, her wise counsel was treated with so much indifference that she saw it was useless trying to control him. He always agreed in everything she said, and then proceeded to follow his own course as if she had not spoken. He was open-handed and generous when the exercise of these virtues cost him no effort.

But when he announced the date of his marriage with Mina Fairfax, the mother made a determined stand. She would never consent.

'Very well, mother,' responded George in his lazy way: 'it's a pity; but I must try to content myself without your consent. I know that you wished me to take one of my many cousins, so that the whole of my father's property should remain in *your* family. Very sorry that I cannot fall in with your views. But such is life: our pet hopes are always disappointed.'

'Is not Rhoda Hartford a girl fitted in every way to make any man happy?' demanded the mother gloomily. Rhoda was the most favoured of all her nieces, and a frequent guest at Broadmarsh, in the expectation that George would fall in love with her and marry, as it would save him the trouble of seeking a wife when one was ready provided for him.

'I daresay she will make some man happy; but I am not the man. My arrangements are already made, and so there is no use bothering yourself about it.'

She said no more; but her conduct was strange to a degree that an observer would have called unnatural. George encountered sullen, obdurate opposition every attempt he made to interest his mother in the forthcoming event. She would not see her future daughter-in-law; she would leave the room the moment her name was mentioned.

He passed over all this lightly. He thought it stupid and ridiculous on his mother's part to sulk so long because he had chosen a wife for himself and had disappointed her in not taking the one she had chosen. He had no doubt everything would come right in the end, and had no suspicion that she had any other reason for disliking Mina than was to be found in her chagrin at the overthrow of her own pet plans.

He saw little of the persistent torture Mina had to endure. At first, she was bewildered by it, and found excuses for it without speaking to her husband. She hoped that in time she would gain the esteem of her mother-in-law; or at anyrate forbearance from undisguised insult in the presence of servants and covert sneers in the presence of visitors. But as months went on the nagging became keener instead of abating, and became intolerable when Mina's babe was born. When she did venture to ask her husband to

remonstrate with his mother, he only laughed. 'Don't mind her,' he would say, in his easy-going way; 'she is a bit eccentric, but she is all right at the core. Do as I do—laugh and pass on. She has never bothered me.'

'Ah, but you do not, you cannot see'—There Mina stopped—it seemed so fearful to be making complaints to a son about the cruelty of his mother.

He did not see. The shooting season took him to Yorkshire or the Highlands; the hunting season kept him out every day; the principal races had to be attended; and there were occasional trips to London, where he spent a week or two *en garçon*, enjoying himself with his old chums at the clubs and theatres. He was quite unconscious of neglecting any of the duties of a husband. He did as he saw other men doing, and supposed that the wife's place was at home, except on ceremonial occasions. He had taken her to Paris and Rome, and twice to London during the first eight months of their union. He was ready to take her anywhere she wished to go, if she asked him. But the Hon. Mrs Chisholm always formed one of the party, and so Mina obtained little relief from the tyranny under which she suffered in the place she was obliged to call her home.

Had Mina's father lived, she would perhaps have appealed to him; certainly, she would have done so when driven to such a state of despair that she fled from the house. He, however, had died four months after her marriage, leaving his affairs in much confusion and embarrassment, owing to the utter collapse of several Companies in which he had invested his savings. This was another lever for the Hon. Mrs Chisholm to use, and she used it unmercifully.

When Mina's boy was born, he was taken from her, and given by the grandmother into the charge of a big coarse-looking woman who had been in the service of the Balhooleys for many years, and was devoted to the family. Mina wished to nurse the child herself. She was not allowed; he was to be brought up by hand, on the plea that she was too weak to afford him sufficient nourishment. She was rarely allowed to see him, despite her appeals; and yet George Chisholm was having the statement dinned into his ears that Mina had no natural affection, and did not care for her child.

When told that her boy was dead, and charged with being the cause of his death by her neglect of him, she lost her reason, and fled from the house during her husband's absence. The note of assignation was found under her pillow; and the Hon. Mrs Chisholm congratulated herself and her son on having done with 'that wicked woman,' who had cajoled him into an utterly unsuitable union.

The young Squire, however, did not take matters precisely in the way his mother had anticipated. When she showed him the note he recognised his friend Blaxland's penmanship—he knew it too well to have the slightest doubt of the genuineness of the document. This was no forgery. Then the ugly nurse, Flaherty, told him where she had found it. But, instead of cursing Mina and his friend, he cursed himself. No words of self-condemnation strong enough for the neglect of which he had been guilty were

to be found in his vocabulary. He could see it all now, although he had been blind so long. He turned fiercely upon his mother. 'I have destroyed the happiness of the best woman that ever lived,' he said hoarsely, 'and you have had a hand in it. I should have known that she could not change from the bright intellectual girl I knew, to the frightened fawn who clung to me so despairingly every time I left her, even for a few hours. It was the terror you inspired her with that made this house a pandemonium to her. I do not wonder now that she grasped at any means of escape from it.'

'George! you are beside yourself, and forget to whom you are speaking,' exclaimed the mother indignantly. 'You are in a rage with me instead of with that woman, who has brought disgrace upon us all.'

'We have brought disgrace upon ourselves. Leave me, or I shall perhaps say things to you that I would not like to remember. But it is I—I, who am to blame.'

'I think you will be the better of a little time for reflection. You have already said more than a son has any right to say to his mother.' She left the room furious, but was careful to take the compromising note with her lest he should tear it up. In all her speculations as to how he would take the news of Mina's flight, she had not foreseen the possibility of his regarding it as a wild protest against his own neglect—unpardonable neglect, as he saw things now—and his mother's unveiled dislike. She had expected him to be furious with Mina, probably to assault Blaxland with a horsewhip, whilst he took immediate proceedings for a divorce. But he was an honest fellow at the core, although too lazily self-indulgent to take action in any disagreeable affair unless driven to extremity. Now, he realised that the blame and shame were his first of all, and his mother's next.

As she stood alone in her own room, the Hon. Mrs Chisholm was mentally repeating one bitter question: 'Shall I fail?—Shall I fail? After all I have done and endured, shall I fail? Will that woman rob me of everything, and will this fool of a fellow—my son!—help her to do it? Oh, if I dared to speak—but that is nonsense. I should gain nothing but scorn if I spoke now. No; I must be silent to the end.' She had been deep in these reflections at the time when Dr Aynsley arrived, and he had presented a new vexation to her. Mina had not eloped or disappeared long enough for George to be brought to believe that she had done so or had intended to do so. She was lying ill somewhere near, and this meddling young doctor would certainly carry out his threat of going to the police station and reporting all that had passed, if he was not prevented in some way. Should George discover that a man had sought him to demand his help for Mina, and she had turned him away without granting the desired interview, the consequences might be much more serious than any she had contemplated when she answered Aynsley so resolutely. The impudent fellow must be prevented somehow from carrying out his threat; but she would find means of making him pay dearly for his partisanship.

She waited anxiously for the return of her messenger; and in half an hour, which seemed

like a day to her, Gedge reappeared. 'Did you overtake him?' she queried eagerly, before the door was closed.

'Yes, ma'am. He was stopped at one of the cottages to see a sick child.'

'Is he coming back?'

'No, ma'am. He sends his compliments, and says he will wait at home until one o'clock—the address is on his card—and if you and Mr Chisholm will call before that hour, he will discuss the business further.'

'Tell Dent to get the carriage ready immediately. I am going out.' She swallowed the humiliation of having to submit to this fellow's dictation, and decided to go to him at once. But she would not ask George to accompany her.

On reaching John Aynsley's modest residence, she was shown into the consulting-room. It was a cold-looking apartment: linoleum on the floor, four chairs and a couch covered with brown leather, a writing-table, and a large bookcase covering one wall, comprised the furniture. 'Poor,' was the Hon. Mrs Chisholm's sniffing comment as she surveyed the place. 'I daresay matters can be arranged.'

Aynsley entered the room and bowed coldly. Before he could speak, she opened the conversation with effusive graciousness.

'I followed you at once, Dr Aynsley, in order to express my regret for being apparently so ungrateful for your kindly efforts on our behalf. But you must make allowances—I am sure a man of your experience and gifts will make allowances for the distracted state of my mind in seeing, as I believed, my son's whole life wrecked by the conduct of the woman who should have been everything good to him.'

'I can understand that the letter you showed me must have caused him the greatest pain,' responded Aynsley, with a grave look into her eyes; 'but I had hoped that Mr Chisholm would have come with you to discuss the best measures that may be devised under the circumstances. A very grave mistake has been made in regard to Mrs Chisholm's conduct.'

'It was impossible. He is perfectly prostrate with grief and shame, and a little more excitement might have fatal consequences. Consider—his child lying dead in the house, deserted by its mother! It would have been cruel to disturb him.'

'I should have thought he would have been relieved by learning that the mother had deserted neither him nor his child,' was the dry rejoinder.

She winced, but went on volubly. 'Would he have been able to accept that assurance at once? No. I have telegraphed to Norwich for the only medical man he has ever agreed to consult. When he has seen him, we can decide what is to be done. Meanwhile, I throw myself entirely on your consideration. Do whatever you think is best for Mrs Chisholm, and I will be responsible for all charges. Then, as soon as she and my son have recovered strength, we—that is, you will explain matters, and a reconciliation will follow. That is, I think, the best course for me to adopt for my son's sake, and for you to take as a friend of the unhappy wife.'

The proposal was reasonable, and if George Chisholm was in the condition she described, there was no alternative course that a sensible man

could take for the benefit of the principal persons concerned in this melancholy affair. And yet, in spite of her apparently sincere anxiety to put matters right, he felt that the woman was false, and had some ulterior motive for this entire change of humour towards Mina.

'I will do as you desire, madam,' he said gravely, after a few minutes' reflection, 'on condition that you do not ask me where Mrs Chisholm has found a refuge until I can tell you in the presence of her husband.'

'I will be guided entirely by you, Dr Aynsley,' was the almost humble answer. 'But you will of course now do what you can to prevent any publicity of this miserable affair, and there will be no application to the police—you said that you wished to spare her the scandal such a proceeding would involve.'

'And I do. My desire is to restore her to Mr Chisholm as quietly as possible.'

'Oh, I am so grateful! Thank you—again and again, thank you. I do not attempt to disguise the fact of which you are aware that my daughter-in-law and I do not get on well together; but that will not prevent me from doing my duty to my son.'

'Until I can see him, I will do nothing more than see that all Mrs Chisholm's wants are properly cared for.'

'Thank you, once more; and for the present, please use this on her account.' She placed four five-pound notes on the table, and took her leave, promising to call next day to learn how the patient was progressing.

As she was being driven away, John Aynsley was asking himself this curious question: 'What motive *can* the woman have for this determination to part Mina and her husband?'

The Hon. Mrs Chisholm's round florid face became dark as soon as she was seated in the carriage and her back turned upon the doctor's house. Her lips were closed tightly, and there was an evil light in her eyes. 'Before to-morrow morning,' she was thinking, 'I shall have discovered where that woman is hidden, in spite of the precautions of this friend of hers. Before to-morrow night, George shall leave Broad-marsh; and before he returns, it will be too late for any reconciliation.' There was a cruel smile of triumph on her face, and the evil light in the eyes became more intense.

As the carriage stopped, the hall-door was flung open by Gedge, and he descended the steps to wait on his mistress.

'Has your master asked for me?' she inquired as her feet touched the ground.

'No, ma'am; but he has gone out.'

'Gone out! When?'

'About half an hour ago. He did not call for anything; but I was on the watch, as you instructed me, and spoke to him as he put on his hat in the hall. I inquired if I could do anything for him. He said "No" quite short, and went out.'

'Did he walk or ride?'

'Walked, ma'am, down through the meadows, as if he was going over to the Denes.'

'In the direction of Mr Blaxland's?'

'I think so, ma'am.'

'Let the carriage wait, and tell Flaherty to

come to me at once.' She proceeded to her dressing-room and threw bonnet and cloak aside. The information that George had gone out was alarming; but if, as she supposed, he had gone to inquire about Harry Blaxland, he would learn—as she had already done—that his friend had gone to London on the previous day, leaving no address, and giving no date for his return. That would confirm the impression made upon George by the note which had been found under his wife's pillow. But if he should happen to meet Dr Aynsley, he would learn where Mina was; he would go to her, and there would be an end of the hope the Hon. Mrs Chisholm cherished of separating the two. She had schemed for that object ever since the marriage, and circumstances had singularly favoured her up to this point. Now, if he should discover that she knew Mina had not gone away with Blaxland, he would suspect all the rest, and would turn upon her. Easy-going as he was in every way, once his passion was aroused she knew that it was uncontrollable, and he became capable of the wildest action. But she did not fear him, if prepared beforehand to encounter his wrath; for she believed that it was in her power to compel his submission to her will. To do that, however, would involve a confession on her part which she would rather not make.

A sharp knock at the door and Biddy Flaherty entered. She was a tall gaunt woman with hard sharp features and cunning gray eyes. Although fifty-five, she was strong and active. As already stated, she had been in the service of the Balhooleys since childhood, and was devoted to the Hon. Mrs Chisholm, whom she always addressed as 'me lady,' that being a bit of playful Hibernian flattery which by no means displeased her mistress. This was the person who had been forced upon Mina as a nurse at one of the most trying periods of a woman's life, the birth of her first child; and this was the woman to whom the poor child had been entrusted.

'Did you see the man who called here this morning?' inquired the mistress.

'Av coorse I did, me lady. D'ye think any man can come here without me seeing them?'

'Would you know him again?'

'As aisy as I'd know your own sweet self, me lady.'

'He is Dr Aynsley; this is where he lives' (pointing to the doctor's card on the table). 'I want to learn what patients he calls on to-day, and, if possible, their names.'

'If I wance get sight of him, I'll know everything he does till he goes home for the night.'

'It seems that woman has not gone away, as we thought, but is somewhere in the neighbourhood under the care of this doctor. He will not tell me where she is, and I want to find out.'

'More shame for her to be skulkin' about the place afther what she's done. But I'll find out where she is, me lady, you may go bail for that.'

'As soon as you find out, get a cab and come straight to me. I wish to spare my son the pain of meeting her until he has recovered from the shock she has caused him.'

'Oh, the poor gentleman!—it's the wondher to me that he can think of her at all now.'

'Get yourself ready at once. Dent will drive

you as far as the Yarmouth workhouse. Get out there, and walk the rest of the way. Tell Dent he is to come home, and be sure you do not let him know your errand.'

'An' sure me lady knows she can trust me to howld me tongue.'

Biddy Flaherty departed on her errand and her mistress watched from the window. The Hon. Mrs Chisholm's expression was an unpleasant one—full of anxiety mingled with spitefulness. 'Must it all come out in the end?' she asked herself whilst looking vacantly across the lawn. 'Well, if it does, there will be scandal, of course; but I will get the credit I deserve for the sacrifice I made, and George will have reason to be sorry for having driven me to extremity.'

VARIALE STARS.

Few persons unacquainted with astronomy fail to express surprise on first learning that there are stars in the heavens whose light is variable. Stellar variability seems at first sight incompatible with the stable and eternal character of the heavens, and gives one the idea of change and evanescence among the celestial bodies. But that such a fact should be associated with the waxing old of the firmament is the result of ignorance and preconceived opinion, as the phenomena of variability have probably been recurring with undisturbed regularity for thousands and thousands of years.

Several scores of these variable stars, as they are called, are visible to the naked eye, and their changes may be watched by any one sufficiently well acquainted with the face of the heavens; while, when we call in the aid of the telescope, the scores rapidly increase to hundreds. Indeed, it is not too much to say that could the millions and millions of stars at present known to astronomers be subjected to rigorous scrutiny, probably many thousands would prove to be variable. These marvellous objects present little uniformity of character; they differ from one another in magnitude, period, and range of variation. Some are very bright; others, even at their maximum brilliancy, invisible to the naked eye. One changes so little that it is difficult to determine its variability; another runs through a scale of fluctuation extending to five or six magnitudes. In period, again, or the time from maximum to maximum, there is the utmost variety. Some complete their cycle of changes in a few days; others occupy many months; several have been steadily decreasing in light within historic times; while with temporary stars, their appearance is so rare, and our term of observation so limited, that it is impossible to say whether their changes occur periodically, or whether the sudden increase of splendour is to be regarded as the announcement of a stellar catastrophe.

The space at our disposal is much too limited to give an account even of the most important of these objects, but we may perhaps be allowed to draw attention briefly to two of the most rapidly variable in the northern heavens. The more conspicuous of these is situated in the constellation of Perseus, and was known to the old astronomers by the name of Algol, or the

Demon. For about two days and thirteen hours this object remains quite steady as an ordinary second-magnitude star, and during this time presents no appearance of peculiarity. At the end of this period, however, it suddenly begins to diminish in splendour, and goes on fading till, in three hours and a half, it has decreased to the fourth magnitude. This brilliancy is retained for the remarkably short space of only eighteen minutes; and in another three hours and a half the star has regained its original splendour. When one remembers that this object is not a mere light hung up in heaven, but an immense luminary like our own sun, some idea will be gained of the nature of the causes that are able to produce such change. The other object, though much fainter than Algol, being, in fact, scarcely visible to the unaided eye, is even more rapid in its fluctuation. It is situated in the constellation Cepheus, but being an inconspicuous object, has not the honour of a popular name. This is the most rapid variable known. Its range, like that of Algol, is a little over two magnitudes; but its rate of diminution is nearly twice as rapid, as it passes from the seventh to the ninth magnitude in two hours. The change of light is accompanied by a remarkable change in colour, the star being bluish at maximum and ruddy at minimum, with intervening gradations.

What explanation have scientific men been able to give of these phenomena? At an early stage, it was suggested that diminution of light might be occasioned by the intervention of a dark body, as a satellite, between us and the primary; and in the case of such rapid variables as Algol, in which the changes are effected in a few hours, some such explanation seems absolutely necessary. But the weakness of this theory is that, while accounting fairly well for variation in stars of short period, it fails altogether with those whose changes are slower and more prolonged. However plausible it may seem that a temporary decrease of light of a few hours' duration might be caused by the sweeping of a dark body across the face of a star, it is evident that when the change in brightness is so gradual as to extend to weeks, months, and even years, the explanation breaks down, without at least assuming motions in distant heavenly bodies as sluggish as those in our own vicinity are rapid. Nor, in addition to this, must we overlook the high improbability of the plane of revolution of these attendant dark bodies coinciding in so many instances with our line of vision. Thus, though the satellite theory has at the first blush an air of plausibility, it must be regarded as utterly inadequate to explain any save a small portion of the phenomena.

Another theory has been advanced, accounting for variability by the presence of dark areas on the surface of these distant luminaries, the alternate apparition of the dark and bright portions as the body rotates on its axis causing an alternate diminution and increase of splendour. The same objection applies to this explanation as to the last, for in the case of a star which has been gradually fading during many generations, it is plain that we must suppose a rate of rotation altogether at variance with ascertained facts, nothing being more surely established than that the motions of the celestial bodies are rapid almost beyond conception. Nevertheless, in a

slightly modified form this theory is not without some degree of probability. The star nearest us, and about which we have the fullest information, namely, our own sun, is nearly always marked with a greater or less number of dark portions, called spots, which have regular maxima and minima, with periods differently estimated by different observers, but generally believed to be about eleven years. These spots must in some way influence the amount of light and heat emitted by the sun, though the difference is to us imperceptible; and were they very much increased, it seems unquestionable that our sun would appear to the inhabitants of a neighbouring system as a variable star with a period of eleven of our years. The only objection to this theory is that we require to explain the explanation. To say that the change of light is caused by the presence or absence of dark areas recurring at stated intervals, is simply stating the problem in different terms. What is the cause of the dark regions, and why should they recur at stated intervals? Why should some stars be exempt from them, and others condemned to their periodic eruption? Must the first be regarded as in the full flush of life and vigour, while the latter are moving down to decrepitude and decay? What are we to make of those stars that have been slowly fading since the first astronomers recorded their observations, or what of those whose change of brilliancy is accompanied by a change of colour? These questions raise difficulties with which the theory is unable to cope, and which with our present knowledge we cannot explain. Meantime, astronomers continue to record observations, to heap particular on particular, in the hope that when the mass has become sufficiently large, some great law will loom vaguely into view, and reward the labour of centuries. If we were allowed to express an opinion, we should predict otherwise. Probably the discovery will be made in an entirely different manner—perhaps in the dingy laboratory of the chemist or the physicist. Some new fact as to the shiver or clash of atoms, some unobserved peculiarity in the behaviour of light or heat, will flash suddenly into view, and in a moment reveal the great law which underlies and governs these strange phenomena.

'SCOT.'

THE canine race have of late been much before the public mind. The exertions of Messrs Pasteur, Henderson, and Warren have rendered it impossible for them to complain of being overlooked or forgotten during the past two years. Indeed, they seem to be rising daily in the scale of social importance; and this emboldens me to lay before a sympathising public one of my many and varied experiences in connection with our four-footed friends.

I am a great lover of dogs; so is my wife; we are childless, and console ourselves by bringing up small families of quadrupeds, whom some of our friends—whose tables are richly set about with olive branches—occasionally observe are more tractable and grateful than the more costly and troublesome bipeds. Like most dog-lovers,

I prefer thoroughbreds; and the first years we lived in London we were the anxious possessors of a pair of 'show' fox-terriers. But their constant unaccountable disappearances, and recovery at considerable cost of time and money, exhausted my patience, and threatened to exhaust my purse; so that, when death removed these little friends, I determined to be no longer a source of income to dog-stealers, and hence resolved to fill the vacant post of household pet with a mongrel.

If there is one thing of which I am a judge, it is a dog. I do not mean merely learned in the 'points' of different breeds; but that, given the opportunity of observing the shape of a dog's head, the cock of his ears, the way he carries his tail, the expression of his eye as he follows his master—I will tell you whether that dog is worth making a friend of or not; and I have never found myself mistaken in a dog whose appearance pleased me. Therefore, my wife and I were agreed that I should look out for a good intelligent dog of a size and disposition difficult to make 'disappear,' and so decidedly a mongrel as not to be worth stealing outright.

While we were still (metaphorically) in mourning for the last of the fox-terriers, we found ourselves in an out-of-the-world village high up among the hills of the Derbyshire Peak. Here I saw a sheep-dog, which I felt sure would suit us exactly: a straight-limbed, broad-chested, dignified-looking animal, about the size of a collie, but stouter built and short-haired; of an uncommon blue-gray colour mottled with black, white points, and a pair of curious 'wall-eyes,' the iris like a bit of pale, blue-white china. The lines of the head and the expression reminded me of the dog in Landseer's 'Shepherd's Chief-mourner.' This dog was invariably seen half a yard behind his master, who was the village butcher; and one day, encountering the pair in the bar-room of my inn, I endeavoured to establish friendly relations with both. The dog received my overtures with great reserve; and when, with sad want of good taste, I pressed my attentions on him, he slowly rose, and with a glance of his eye from me to his master, which plainly said, 'My concern is with *him*, and I can have nothing to do with strangers,' withdrew under the settle. I subsequently pointed him out to my wife, telling her that in that dog we should find all we sought.

'That wild-looking creature! with glaring white eyes and a coat like bilberry dumplings!' exclaimed she. 'Why, we should be mobbed, if we took him out in London!'

Notwithstanding this protest, I took the first opportunity of meeting master and dog in the bar-parlour, and—his local value being ten shillings at most, bought him for fifteen; and by the help of a command from the butcher, 'Go on, Scot,' led him into our sitting-room and presented him to his future mistress. Whether he understood the bargain struck in the bar, or by what means he grasped the situation, I cannot say; all I know is that, though his late

owner's shop was only across the road, he never made an attempt to return to him; indeed, he scarcely took any notice of him if we happened to meet. I do not think this was ingratitude, but arose rather from a keen sense of what was due to a new master moving in an altogether different position in life. By the time we were returning to London, Scot had not only attached himself to us, and grown perfectly accustomed to the more refined habits and manners of the society in which he now moved, but had justified my opinion of him by showing a great amount of general intelligence. Bringing him, as we did, from a part of the world where two vehicles appearing in the village at once was looked on as quite an excitement, we were afraid he would lose his head in the crowded and noisy streets of the great city. We were agreeably surprised to find that, beyond fixing his eyes anxiously on my back and keeping well to heel, the first time I took him up Oxford Street, he showed no sign of nervousness or fear; and in a few days was quite at his ease, following a 'bus with myself outside in a most collected and business-like manner; and on once losing me in the press at the Marble Arch, returning promptly to our house in Notting Hill.

After a time, finding that from any place to which he was taken on foot, he would find his way home, and that he never allowed any one to take liberties with him in the street, or responded to the blandishments of strangers, we felt that he could scarcely be lost or caused to disappear; and as he certainly was not worth stealing, we rested happy in the belief that only death would deprive us of Scot. His appearance, too, being so strikingly odd, we flattered ourselves that if anything did happen him, we could not fail to trace him easily and speedily.

Three peaceful years followed. Scot endeared himself to a large circle of friends by his urbane manners, amiability, and general intelligence; became quite a feature in our square, and was well known in the neighbourhood; for he would sit patiently for an hour at a time outside a shop-door, with his opal eyes fixed on the spot where he had last seen my wife's retreating figure. Sometimes a knot of admirers would surround him, talking to him and stroking his grizzled head; but Scot, though he bore what he considered their ill-timed caresses with unflinching good temper, never withdrew his attention from the business of the moment—watching for his mistress. Respond he would not.

Three happy years went by, and then came the Henderson ukase—Muzzles! Scot remonstrated so pathetically against the double infliction of collar and muzzle, that, telling ourselves the name and address upon it could be of no service, since he never got lost, we, in an evil hour, removed the former; and 'Old Scot'—as he was affectionately called, though only now four years of age—trotted about, presenting his muzzle to every human friend he encountered, requesting its removal in the plainest language. This he did with the persevering and trusting hopefulness of a dog who has never been neglected, and feels sure he has but to make his wants understood to have them attended to. One day—a black and fateful day in the annals of modern

London, a day of frost and ice, of riot and fog—my wife and I started early in the day to skate at Hendon. Scot accompanied us to the nearest Metropolitan Station, and was then told to go home. We believed he went; he had never disobeyed us before, and we never dreamed he would do so then. Returning at past six o'clock, there was no sniffing under the door, no impatient whine and scratch, no boisterous greeting as the door opened.

'Scot, sir?' said the servant, interrogatively as we entered.

'Did he not return?' we asked in surprise. No; he had not returned. But we were not really uneasy: he had probably made himself a self-invited guest at the house of some friend near, as he had once or twice previously done. If he did not return before the house was closed for the night, we could send for him in the morning. It was only when we found he was not at any friend's house, that we became anxious, and reflected, that being without a collar bearing his owner's address, the police, in their new-fangled zeal, might, though muzzled, 'run him in'; or, worse still, being muzzled and defenceless, he might even have been made to 'disappear.'

We first made inquiries in and about the station whence we had dismissed him; these, however, led to nothing, and then began the weary round of police stations and Dogs' Homes, with, as usual, no result. Of course the police promised to do all they could. All they did was this: two days after our loss, while I was out, an inspector called, and was received by my wife. He was a youngish man, of bashful manners, who informed her that a dog 'answering to the description' had been found that morning sleeping in a square close by.

'That is not our dog. If he were loose anywhere within ten miles, he would come home,' promptly decided my wife.

After this, advertisements appeared in different papers offering a reward for the restoration of a 'Mottled Black and Gray Short-haired Sheep-dog, with wall-eyes, white points, long tail, with white tip,' &c.

'We shall not be troubled as we used to be when the fox-terriers were lost,' said my wife hopefully. 'Gray dogs are uncommon, so are "wall-eyes";' in fact, there is not a dog in London like Scot. We shall have but one brought, and that will be the dear old fellow himself.'

And I confess I had also some such idea. But we reckoned without the host—of fools, which London can produce at a moment's notice anent any occasion or subject whatsoever.

The first advertisement brought us a small but choice assortment of dogs. No. 1 arrived early, carefully led by one man, the expedition being conducted by a second, who was spokesman. It was a spotted carriage-dog of Dalmatian breed.

'This is not a sheep-dog,' I said.

'Advertisement said "wall-eyes," sir, and a long tail; and this has wall-eyes and a long tail, sir.'

'Very well; leave the eyes and tail, then,' said I, intending to be severely ironical: 'the rest does not answer to the description.'

The man grinned, and, on the strength of my joke, asked for a glass of beer. This being politely refused, he retired, to be speedily suc-

ceeded by a Whitechapel rough, leading a miserable, dirty, curly-coated, brown mongrel.

'Beg yer pawdon, sir,' said this worthy, 'but be this yer dorg?'

'Can that by any stretch of imagination be called a gray sheep-dog?' I asked indignantly, trying to shut the door, which the rough held open with his hobnailed boot, while begging me to consider that he had walked all the way from the east end, &c. A few determined words, however, send him off cursing; and I felt sorry for the poor brute—I mean the four-footed one.

The third animal submitted to us was a large half-bred hound, liver colour and white, with a black spot on his back—on the strength of which he was brought—and a pair of lovely blue hazel eyes, which seemed to plead that he might be owned and taken in.

For the remainder of that day, and—our advertisement being repeated in the leading dailies—for many days after, not only did dogs of all sorts, sizes, and colours arrive at frequent intervals for inspection, but letters came by every post, and even two or three telegrams, from all parts of London, its suburbs, and for fifty miles round, from the Midland counties and the south coast, informing us that dogs 'answering to the description' might be seen on applying to the sender.

At first, either my wife or I went to all places within reach, to see—collies, terriers, mongrels, black, tan, white, liver-coloured, long-haired, curly-coated, bob-tailed, or no tail at all—animals whose sole claim to 'answer to the description' consisted in their belonging to the canine race; for in some cases they were not even of the right sex. After a time, we got wary, required detailed particulars, and sent photos of Scot in the first instance, which plan we also pursued in the case of more distant correspondents; but even with these precautions, we took one or two tiresome journeys, only to encounter disappointment. It was not merely that every one seemed to have gone colour-blind, but that most persons appeared to think that if a dog 'answered to the description' in one point, that was quite sufficient reason to suppose it ours; if in two—the evidence that it *was* ours was held to be overwhelming; and when we had the hardihood to declare that it was *not* ours, they evidently considered themselves ill-used, and in more than one instance plainly showed that they thought I alone was to blame for the useless trouble they had had, and therefore that it ought to be made good to them.

'My dog was described as long-tailed,' I would remonstrate, 'and this one has *no* tail.'

'But it is wall-eyed,' would be the reply.

Or my objection, 'This dog has not got a gray hair on him,' met with the rejoinder, 'He's a sheep-dog, and has a long tail with a white tip,' and this in a tone of conviction, as who should say: 'If he's not your dog, all I can say is, he ought to be.'

In one particularly aggravating case, where information was brought of a dog kept mysteriously in a backyard, and I, after some difficulty, obtained sight of an animal which, beyond possessing four legs and a head, bore no single point of resemblance to Scot, I indulged in a little strong language, and my informant, in a deeply aggrieved tone, remonstrated thus: 'I

got a bone, held it out, and called "Scot, Scot!" and he came up wagging his tail and took the bone; so *in course* I made sure it was yours!"

After a certain time, seeing that this was no mere 'disappearance,' I had offered a reward of double the dog's value for 'information leading to his recovery.' Upon this, a perfect rain of letters set in, the orthography and style of some of which were amusing; for example: 'DEAR SIR in respec of yer notiss i seen the dogg he cum into our Shop i giv im a Biskitt wich you did not name is name so plees rite and say also if your dogg is a Ladye dogg yours to comand,' &c.

Some were aggravating, as, for instance, two advising me 'to apply at the Dogs' Home;' and one—from an elderly spinster, I feel sure—informing me 'that she had always found the police most useful in restoring valued dogs.'

But the most original was one from a gentleman claiming the rank of captain in the army, who stated that 'he knew where the dog was, but should require the reward to be forwarded by post ere he parted with the information.' This demand showed a touching confidence in the guilelessness of my nature and anxious affection for my pet, that was not justified by results.

At last, having done all that could be done—advertisements and handbills having been as widely spread as was in our power to spread them, exhaustive inquiries having been instituted to ascertain if he had been in any way killed; a humble friend of ours 'in the trade' having communicated in a friendly way with others 'in the trade'—nothing was left for us but to await the result.

Alas! reader, we are still awaiting the result, or rather, since many months have passed, we have ceased to expect any. Our mongrel dog—truly 'of no value to any but the owner'—in spite of widely offered rewards of four times his intrinsic worth, his singular appearance, and his keen intelligence, has finally—disappeared.

CIVIL SERVICE REFORM.

To the very numerous class of young men and young women who are regulating their studies in accordance with the announcements of Her Majesty's Civil Service Commissioners, it will be an interesting and almost exciting piece of news to learn that Sir Matthew Ridley and his colleagues, who were appointed to conduct a special inquiry into the Civil establishments, have issued a second Report, containing a variety of recommendations as to the better organisation of government offices. The subjects of their inquiry are of the greatest possible interest to all who look forward to becoming servants of the Crown, and it is satisfactory to notice that to a large majority of these anxious ones the result must prove reassuring and gratifying. 'The numbers, salaries, hours of labour, superannuation, cost of the staff, and the administration, regulation, and organisation' of the Civil establishments have now been once more pretty thoroughly investigated—that is, so far as the mere taking of evidence may be held as equi-

valent to an investigation. No deliverance is yet given, however, on the vexed question of the amalgamation of the Inland Revenue and Customs departments, and to that extent the candidates will for some time be kept in a state of suspense. A very considerable extent of ground has nevertheless been covered, and many wise suggestions have been put forward.

In saying that the result of the inquiry will be gratifying to the majority of candidates we mean that the suggested changes will tend to the benefit of the rank and file as such. They will not probably increase their chances of securing any of the 'prizes' of the service, for these prizes are in future to be much less numerous. This provision will of course fail to commend itself to candidates for the Higher Division—that is, those who are required to pass an examination practically equivalent to a university degree, so that they may be prepared to take broad views of public business, and do the responsible work involving discretion and judgment, as distinguished from that which is 'purely clerical.' It has been decided that the latter class of work is more largely predominant in government offices than the outside public have been led to suppose, and therefore economy can be effected by a reduction in the number of highly paid clerks. This saving on the one hand will enable the government to be somewhat more liberal in their treatment of Lower Division clerks, who, by the way, are to be propitiated with the title of 'Second Division.'

At present, the Lower Division clerk entering a seven hours' office receives £95 a year, and advances by triennial additions of £15 to £250, with the chance of some day receiving £100 extra for special duties, such as superintendence. Ever since this scale was established, it has been recognised that while its treatment of the raw recruit from school errs on the side of liberality, the progression towards the maximum salary must appear somewhat slow after family responsibilities have been assumed. It must be distinctly understood that the extra emolument or 'duty pay' of £100 (or less) cannot be reckoned on as a prospective benefit, but is dependent to a large extent on accidental circumstances—such as, the number of the staff, the vacancies that may occur, and perhaps in some cases the whim of a superior officer. These defects in the Lower Division system appear to be satisfactorily dealt with in the Report. The commencing salary is reduced to £70, and the rate of increase is £5 a year until £100 is attained. Then, with a satisfactory certificate, the clerk will progress by annual additions of £7, 10s. to £190; and finally, if he has proved his fitness for further advancement, he will proceed by additions of £10 a year to a maximum of £350. This point is now reached only in exceptional cases: in future it will be open to all men of character and ability. The chances of still further advancement must, from the nature of the case, be slender, as the higher posts are to be few in number, and some of them

at least will be filled by those whom we may term university candidates. Nevertheless, no hard and fast line has been drawn to bar 'exceptional ability' from rising to its proper level.

To the First Division it is hoped to attract men who would otherwise enter a profession with a fair prospect of success. To induce men of the requisite capacity to take part in a competitive examination with a view to entering an office, a minimum salary is suggested of £200, rising by £20 to £500. Clerks of the second grade would progress by annual additions of £25 from £600 to £800; and in the third grade the scale would be £850 by £50 to £1000.

As to the examinations, no serious modification is proposed. As optional subjects for Second Division candidates—although in a competitive examination all subjects must be practically compulsory—shorthand and one modern foreign language are with some hesitation recommended. It would not be very surprising, however, if shorthand were made compulsory, and the suggestion as to a foreign language ignored altogether. The higher examination is disposed of by the simple suggestion that thoroughness is the quality most to be coveted in advanced studies, and therefore it might be advantageous to limit candidates to a few subjects which must be thoroughly mastered.

There will probably be no disposition in any quarter to contest the propriety of adopting a uniform official day of seven hours, or of compelling those who look forward to pensions to contribute five per cent. of their salaries towards this great and growing expense, especially as these contributions are to be repaid with compound interest in the event of no pension being granted. The necessity also for transferring clerks from one office to another, instead of engaging new ones who are not required, is so obvious as to call for no remark; and whatever difficulties may hitherto have prevented this reasonable arrangement must in future be overcome. The retention of elderly officials, irreverently designated 'fossils,' has often given rise to grave discontent, and forms the subject of three simple proposals. The age for compulsory retirement is fixed at sixty-five; but if the interests of the service seem to require it, a clerk may be 'retired' at sixty; while, on the other hand, if specially invited by the government, he may remain in office until seventy. The absolute prohibition from taking part in the management of trading Companies is a measure which could scarcely be avoided; nevertheless, it must call forth angry protest from those affected, on the ground that government has no concern with the leisure time of its servants. Probably nothing in the Report is more emphatically insisted on than the need for promotion by merit, although of course the witnesses did not fail to indicate the risks attendant on such a system. The superior officer in the Civil Service has little interest in the efficiency of the person he promotes, whereas the private employer would feel that his business interests were at stake in the transaction. For this reason, it has generally been held the safer course to promote the senior in the absence of special disqualification. Before, however, we can arrive at any conclusion on this point, we must see the new regulations at work. These regulations must be promulgated by an Order in Council, which will probably be kept back until the Commissioners

have made their final Report; so that some patience will still be required before we shall be enabled to criticise the details of the latest reorganisation of the Civil Service.

THE DETECTION OF CRIME IN CHINA.

THE Chinese possess no organised detective force, though the officials sometimes visit in disguise the scene of a notable crime for the purpose of making inquiries, and police spies are often locked up with remanded prisoners to try to worm out their secrets. The lower classes being intensely superstitious, the judicial investigation of crime usually takes place at night. The judgment hall is a lofty building of wood, unceiled, and bare of furniture save for the raised dais at the north end, where is seated the presiding magistrate, attended by his secretaries, clerks, and lictors. The only light comes from paper lanterns or cotton wicks in oil-cups, which but serve to bring into prominence the weird shadows flitting about the corners and lurking among the wood-work of the roof. Silence prevails, the few spectators watching the proceedings standing like statues. The accused, dragged from the darkness and filth of a Chinese prison, is forced to kneel before the judgment-seat throughout the trial. Weakened by ill-treatment and appalled by his own superstitious imaginings, he often requires only a little judicious terrorising to elicit a full confession of his guilt. If he prove obdurate, witnesses are called. From these no oath or affirmation is demanded; the breaking of a saucer and other forms for administering an oath to a Chinaman laid down in English lawbooks being quite unknown in Chinese courts. Any hesitation or refusal to answer the magistrate's questions—for he is judge, jury, and crown prosecutor all in one, and no counsel for the defence is allowed—is punished by slaps on the cheek or the application of the bamboo to the thighs; and similar penalties more severely administered check the giving of false testimony. Should the prisoner, in face of strong evidence, persist in denying his guilt, various persuasive measures are resorted to, such as forcing him to kneel on chains, hanging him up by the thumbs, or suspending him by the neck in a wooden frame so that his toes just touch the ground. All such tortures are illegal; but a confession has to be obtained somehow before sentence can be passed, and cases are many, and the time allowed for settling them short. Seldom can the stoutest rogue, or, alas! innocent man, hold out against such treatment continued throughout the night, and renewed, if necessary, again and again.

When two or more persons are equally suspected of theft or the like, the magistrates often show great ingenuity in detecting the guilty. In cross-examination they are peculiarly skilful in obtaining damaging admissions, their suave manner deceiving the accused as to the importance of the point they inquire about so carelessly. Two instances of extra-judicial methods for ascertaining the culprit among many equally under suspicion deserve to be recorded for their cleverness. Some balls of opium taken from a piratical junk by a revenue cruiser mysteriously disappeared while being transferred to the latter vessel. Opium is very precious in China, and a

ball is easily split up and secreted in the wide sleeves or the voluminous waistband of a Chinese sailor. The commander of the vessel was loth to institute a search of the ship and crew, knowing well the craftiness of his men, and that, even if found, the opium would most probably be in the bundle of some innocent man. He therefore resorted to a plan as simple as it proved effective. In his cabin was, as is usual, a shrine of the Goddess of Mercy and of the Chinese Neptune. Before these deities he instituted a solemn service, which was prolonged till evening. When night fell, he mustered the crew and called them one by one into the dimly-lighted cabin. Here each man had to make solemn declaration of his innocence, kneeling before the images, and, dipping his finger in a saucer of water, to smear his face all over, being warned that, if he were guilty, the divinities would make his face appear streaked with black. When the thief's turn came, he tried to outwit the gods by rubbing his finger on the bottom of the saucer; but, to his horror, when he reached the light, his face was all over black marks, the wily commander having held the saucer over a lamp before commencing the experiment.

In another case, where several servants were suspected of theft, each man was given a bamboo of the same length, marked with his name, which had to be deposited in an urn before a small shrine in the outer prison where they were confined. The officer announced that the culprit's rod would grow, by interposition of Providence, one inch during the night. The prisoners were then locked up, no watch being kept on the urn. On the reassembling of the court, one rod was found to be an inch shorter than the rest, as the thief had, under cover of the darkness, endeavoured to circumvent the supposed divine power by biting a bit off his rod.

When any article disappears from a private house and one of the inmates is suspected of purloining it, it is usual, before having recourse to the magistrate, whose underlings exact huge fees for doing anything, or nothing, to call in a priest and hold a commination service. This consists in invoking the evil spirits and bribing them by offerings and music to hound the culprit to death within the year. It continues for three days and nights—if the terrified thief does not confess and make restitution before that time, a result very frequently achieved. Europeans living in China have tried this method, but not with much success, as the gonging and other discordant sounds which constitute the 'music' so effectually drive away sleep that the neighbouring foreigners insist on its being intermitted during the night, and so, say the Chinese, spoil the charm.

Of late years, Chinese newspapers on the European model have been started, and are well supported in the matter of advertisements. So now, the loser of bank-notes or other portable property can, and very frequently does, announce his loss in good Chinese in the columns of one of the three leading dailies, offering suitable rewards for the recovery of his property and the detection of the thief. The European settlement at Shanghai alone of all the towns of China employs regular detectives at the expense of the ratepayers. When, if ever, the Chinese government will follow the example set them by this 'western' community, it is impossible to predict.

WOMAN'S WIT.

[When Conrad III. was in 1133 proclaimed Emperor of Germany, the Duke of Wittenberg refused to acknowledge him as such. The Emperor therefore besieged the Duke, who had taken refuge in his fortified town of Weinsberg. The Duke in the end was forced to yield; whereupon the indignant Emperor declared his intention of putting all to fire and sword, but granted permission to the women to depart in safety, and to carry with them whatever they regarded as most precious. The Duchess of Wittenberg, taking advantage of this concession, with ready wit took her husband the Duke upon her back. Her example was followed by the other women; and the Emperor, seeing them thus come out, with the Duchess at their head, was touched by the spectacle, and pardoned the men for the sake of their wives.]

THEY are hushed—the hoarse voices of battle,
The clashing of shields,
For at sundown, despairing of succour,
The proud city yields.
Then fill me the ruby-red beaker
Brim-high at the spring;
To-morrow we drink amid plenty
'Wass-hael!' to the king!
Oh, sweeter than toil of the bondsman,
Than hawking of lord,
Is the snort of the earth-spurning charger,
The play of the sword.

What, ho! are they pleading for mercy,
The treacherous foe?
Shall we listen with many a brother
Laid silent and low?
Nay, nay; let the women and children
Go forth with their best
Of jewels and house-gear and linen—
Short shrift for the rest.
Oh, sweeter than toil of the bondsman,
Than hawking of lord,
Is the snort of the foam-whitened charger,
The play of the sword.

They come—over-burdened, I warrant,
With treasurings rare;
Wives, mothers, and matrons—by Odin!
'Tis men that they bear!
'Have mercy, O army victorious!
You bid us go free,
With the gold and the gems that we value,
The babes at our knee;
But dearer than house and the children,
Wherever we roam,
Are the treasures we bear on our shoulders,
The shields of the home.'

'There are wives by the strand of the ocean,
And maidens as fair,
Who weep through the whirl of the spinning,
And shield us with prayer;
For the sake of those watching and waiting
Afar by the sea,
For the love and the faith of the women,
Pass on—ye are free!
Oh, sweeter than carnage and glory,
Than jewels and gauds,
Is the neigh of the home-coming charger,
The sheathing of swords.

BLOODHOUNDS AS DETECTIVES.

By GORDON STABLES, C.M., M.D., R.N.

It is coming yet—the time, I mean, when the London ‘bobby’ as he now exists will be as obsolete as the ‘Charlies’ or night-watchmen who, some five-and-twenty years ago, when the writer was a student, used to tramp the streets of the Granite City. We students knew them well; we had good cause to, for we and they were sworn foes. From the time they came on duty at ten o’clock till the ‘wee short hour ayont the twal’ those brawny Charlies had far more trouble with us than with any other class of ‘evil-doers.’ The charge-sheets every morning might have been found well filled, had they only been able to catch us. But they were not. We knew every turn of them, knew the cluntering sound of their foot-steps, the rattle of their iron-shod cudgels, their bass Doric voices as they bawled the hour; ay, and their very shadows in the flickering gaslight. Strange to say, when they were at one end of a street, we would be at the other, and the tricks we played them were many and comical. If it sometimes came to a race, the Charlies were nowhere—how could they be, buttoned up as they were to the neck in such a weight of homespun cloth? As well might a bear attempt to catch a cat.

In the same relation as the Charlies of those days stood to the student stands the ‘bobby’ of the present day to the London marauder. He is a belled cat at night among a swarm of clever, agile mice. The government has belled him, batoned him, bonneted and booted him. There is no mistaking the clang of his iron heel, the steadiness of his step on the stones, the shape of his very head as he stands for a moment at a corner, or the glitter of his cape and truncheon-case on a wet night. Besides, he moves with method as well as rhythm, for he goes the round of his beat as regularly as the moon goes round the earth: if he is found at any particular spot at any particular moment, all the world of wickedness

knows it will be about twenty minutes before he heaves in sight again; and if it be past midnight, then before he does come, his ringing footsteps can be heard sounding loud in the deserted streets.

But all this is bound to be altered in a few years; the authorities will remember their Jack the Giant-killer, and array their night-policeman much as Jack was arrayed, so that he will seldom be seen and never heard. These guardians of the peace will also be entrusted, at times, with revolvers—real revolvers, not the questionable untested weapons they sometimes carry now—and they will be trained to use though never to abuse those desperately handy little shooters.

Another change which shall work wonders in our night police force will be brought about by the systematic use of the telephone. A box or little office will be placed on every beat, at which the man on duty will have to report himself every quarter of an hour to the head office, and in case of need, receive instructions. Such a beneficent innovation would be productive of incalculable good; it means nothing short of having every officer of our vast metropolitan force, within speaking distance and at the very elbow of his chief. The detective department will no doubt be less under command of this executive—in other words, brain will not be dominated by brute-force so much as it is now.

Besides all this, a new and highly intelligent servant to both departments will be added to the forces, and wear the duty-stripes around his neck by way of collar—the Bloodhound. The very name of this noble dog is a terror to evil-doers. I have not the slightest doubt that it was the fact—and that fact alone—of Sir Charles Warren having bloodhounds at his command which stayed the hands of the East End murderers in autumn last. I am writing these lines on the 19th of October 1888, and have no desire to shout before we are out of the wood; but perhaps before this paper is read, we shall have seen that the bloodhounds of this country can do their duty and do it well.

The animal bears a bad name, in a literal sense.

He is supposed by the public to be a dog of extreme ferocity, of gore-lapping tastes, that having once been put on the trail of a malefactor, that malefactor is a doomed wretch; that the hound with the bloodshot eyes and the awful hanging chops will follow him slowly but surely as Fate itself, through streets and lanes of busy towns, into inns where he has slunk to quench his thirst, through woods and wilds, through forest and fern, o'er the watery ford, o'er stony barren hills and beaten paths, and seizing him at last by his guilty throat, will tear him where he stands.

Now, there is a grain or two of truth about this, mixed up with a deal of chaff. But, to begin with, I must say I was sorry to note the wording of many of the letters and papers on this canine friend of ours, when describing his character. I have five of these before me, and each of them is so penned as to give one the impression that butter would hardly melt in the bloodhound's mouth. Letters like these would fail in deterrent effect upon criminality. We might almost fancy a would-be woman-slayer saying to himself as he read these epistles from experts: 'I'm not afraid of a pup like that. I can give him the slip; or if I can't do that, I can give him a bat on the head.'

Now, my own experience—and it is a somewhat wide one—is as follows, and I call upon well-known breeders to correct me if I am wrong. The bloodhound is one of the most sagacious of all dogs; his wisdom even when quite a puppy is sometimes astonishing. When only six months old, he will often show to his master that he has already come to the conclusion that life is real and earnest, and not meant merely to romp and play in. I have had a puppy of this age take me quite in charge, as it were, giving himself all the airs and manners of a dog of seven years old, and going on watch at nightfall as serious as a sentry in an enemy's country. He would look up in my face as much as to say: 'There's nobody in this wicked world worth a thought except you and me, master, and you don't count as far as defence goes; if you please, I'll do the watching for both.'

As a rule the bloodhound is most docile and winningly affectionate. He can be trusted with children; so much so, that a boy may safely do duty as 'the hunted man' when the hound is being trained in hill or forest. The animal is nevertheless suspicious of the motions of strangers; he therefore makes a most efficient guard either to person or property; and his deep, ringing, bell-like voice, heard at night in his own grounds, would be sufficient to keep at bay the boldest burglar that ever went on prowl.

But instances of bloodhounds who, if not actually savage, will, to use a trainer's words, 'stand no nonsense,' are by no means rare. I had the pleasure of being hunted once by one of these. It was in a country where there were plenty of

hills and rocks and running streams, but nothing worth the name of a tree. We were training a pup, and as he was already well up in his work, I had got quite a long start, and had done my very best to puzzle him by wading through water, &c. When I had reached a cosy nook in a far-off glen, I sat down to rest on a stone; but a whole hour passed, and still no appearance of my friend and his pupil was put in. I was thinking I had got well away for once, when I was startled by the sonorous baying of a bloodhound, and next moment found myself a prisoner—made so, not by the puppy, but by the puppy's father. The dog, I afterwards discovered, had escaped from the stable, and come to the hunt on his own account, and here he was. I confess I felt a little uneasy. I knew the dog well enough, but just at the present moment he did not consider it convenient to know me. I felt that I wished to convince him that it was all fun, that we had only been playing at man-hunting. Unfortunately for my peace of mind, the bloodhound would not take that view of the matter. It was no good my holding out a hand and saying, 'Poor fellow, Draco! Good dog, come along then.' This only made him back astern and bay the more. Worse than all, a movement on my part as if to get up resulted in a threatening exposure of some teeth. Draco evidently wished me to understand distinctly that I was the prisoner, and he the detective; I the captive, he the captor. That was the position in all its simplicity; and as it was moreover pretty certain the bloodhound meant to do his duty, I had to do mine, and sit there, till at last my friend arrived with the pup. But the time had seemed very long.

There is a scrutinising calmness and dignity about the eye of a well-bred bloodhound that is quite a study in itself. If you are a perfect stranger to the animal, it is evident he is regarding you not with hatred by any means, nor with affection, but with thoughtfulness mingled with a little suspicion of your intentions, just as a human being would study an ape if one came hopping up to the hall-door.

Both scent and sight are remarkably well developed in the bloodhound, especially the former sense. The shape of the head we encourage now at dog-shows is one in which we have the greatest possible spread of olfactory nerves, the long face in front of the eyes, the expanding nostrils, and deep upper jaw, with hanging flews, &c. Indeed, there is not a point we give in judging that has not a meaning in it. The hearing as well as the eyesight of the bloodhound is extremely acute. They hunt more by scent than sight or sound, it is true, but it would be ridiculous to imagine that when puzzling out a trail, they are not at times aided by either or both the latter senses. The mouth of the bloodhound is capacious. It may be new to some readers to learn that when listening intently to far-off sounds an open mouth aids the ear. Any one can prove this by the following experiment on himself. When travelling by train, let him deafen both ears with his thumbs, and alternately open and shut the mouth. The difference in the roar of the train is well marked.

Our friend the bloodhound is beautifully formed all over for hard work, stands on straight

strong legs, has well padded, well knuckled-up feet, and in shape is quite a hound. Speed, however, is not his strong point. In olden times he was called the 'Slowe hound' among other names, and when the trail was perceptible even to human senses, the dog was taken on horseback, to save time.

The Cuban bloodhound which was used to hunt down the slaves is a much more speedy and ferocious animal than our own hound, which we consider we have brought to a state of very great perfection both mentally and physically; and all good judges agree he is a hound that can be depended upon to work steadily and well and make no mistake. Dr Romanes, in a communication made by him to the Linnean Society, states that a bloodhound belonging to him will readily track his master, but no one else. When we find one of our leading London dailies seriously taking note of this, we have an excellent proof of how little the general public know about dogs in general and hounds in particular. Why, I have known a terrier run away from a rat, and any number of Scotch collies who would not look at a sheep. In both the collie and bloodhound we have the raw material placed ready to hand; it is our duty to train it, if we desire to profit thereby. The training of the bloodhound is very, *very* simple if begun early. We usually have the acting 'runaway man' to rub his boots for a time or two with, say, a morsel of raw liver; but this is soon discontinued, and the pup hunts the clean heel or scent of the man himself.

Here is a point which should be borne in mind by any one interested in the matter. It is the scent of man himself that the bloodhound's instinct sets him after, and not only that, but of some particular man. He has started with this from, say, the scene of some depredation or murder; he has this in his nose and his mind as well; and if he be a well-trained, well-fed, well-treated hound, and free from all nervousness, it will take a very large number of cross-scents to make him swerve.

I put great value on the hound's upbringing and general treatment when not on duty. If the creature has been reared and trained by a fool, and under the influence of fear—if he be not well kept, properly bedded, exercised, and fed, and allowed the companionship of man, he is certain to develop more or less of nervous debility, and ten to one will go wrong at the critical moment.

Anything approaching to ferocity, or even uncertainty of temper, entirely unfits a hound for his work; he should be as docile as the St Bernard, and as much to be depended on even in playing with or hunting children as the Newfoundland. During the recent debate in the newspapers regarding the capabilities of dogs for hunting criminals, many other breeds have been recommended, each and all of which have their merits, but also their drawbacks. Our smaller hounds, for instance, have wondrous scent, such as dachshunds and Bassets, but they lack size and determination; and, worse than all, they give voice. Of course, every owner of a clever dog thinks it good enough for anything, hence we cannot be surprised at keepers' dogs being extolled as fugitive-hunters. Let such animals, I beg to say, be kept to their own work—that of defend-

ing night-watchmen or tracking poachers. One writer says: 'These large valiant and well-trained beasts, mostly crosses between the bulldog and mastiff with a trace of the bloodhound thrown in, will not only follow their man, but when found, *fix* him, and there is no mistake about the matter.' Certainly not, I should answer; there would be no mistake about the fixing, so long as he fixed the right man. The horrible savageness of the fixing will hardly bear thinking about. It would or might be all right so long as the trainer or master was close behind; but suppose the dog escaped and has five minutes' work at his man, what then! No; let every dog do the work for which he was intended; and bloodhounds alone, I maintain, are the only dogs that can be trained to act as police assistants.

It is not, however, in tracking murderers only that the intelligent bloodhound would come in so handy, but a variety of other criminals too numerous to mention. The burglar, for example. It would really, methinks not be going too far to say that in any town where well-trained bloodhounds were kept ready, burglary would be rendered a ten times more hazardous game than it is now, if not an impossibility, without the certainty of detection. If the policeman on the beat found out any time before sunrise that a burglary had been committed, he could make sure of finding his man in an hour, or much less perhaps, unless he had actually taken train or trap away from the place; but even then, he would have what is called 'a clue.' Supposing it were many hours before information was laid, there would still be heavy odds against the thief getting clear away; and in some cases, reset as well as theft would be laid bare. The keeping of police bloodhounds would have a negative and deterrent effect as well as a positive, and this would be the best of it, because prevention is always better than cure.

Some people doubt the possibility of dogs tracking a criminal through the streets and lanes and busy thoroughfares of a great city. They speak of cross-scents; but in doing so they speak of what they do not understand so well as—the bloodhound does. He has got the right scent at the right place, and if he is the right sort of dog, he will stick to that and no other. Besides, it has been done over and over again. Whether to the bloodhound nose every human being has a different scent, I know not; but it would really seem so, else how can the animal follow his man so directly, and single him out among even a crowd of others at a public-house bar or in the bosom of his own unhappy family?

A well-known English breeder speaks of hounds that are attached to the penitentiaries in Texas. The men in charge of them, he says, give most wonderful accounts of the capture of convicts by means of these dogs, although the fugitives had in some instances a twenty-four to thirty hours' start, and in one case they ran their man over forty miles. But these animals are a cross between the Cuban bloodhound and the foxhound, splendidly trained, and kept constantly at work. The same authority avers that our English bloodhounds are infinitely superior to these; and I have no doubt he is right.

On the whole, I confidently advance that with judicious training in the place where he is to be

worked, and from his puppyhood, good housing, good feeding, kindly treatment, and constant practice in hunting men, the bloodhound can be made a most intelligent member of the force.

MR ESHOLT'S YOUNG WIFE.

A STORY IN TWELVE CHAPTERS.

CHAPTER VII.

PRESENTLY, Mr Esholt looked up from his *Blackwood* and said: 'It may perhaps be as well to explain how I and young Burrell chanced to fall in with each other. His father, my brother Richard, and Mr Granby were friends after a fashion which seems to be going more out of vogue year by year. In telling you ladies this I daresay I am telling you no more than you know already. Be that as it may, when young Burrell came to Liverpool previously to his first voyage, he brought a letter of introduction to me from Mr Granby, whereupon I invited him to come and stay a few days with us at Everton; but he was unable to do so. Between his voyages he has called on me two or three times at the office, and I have always been pleased to hear of his welfare. Well, three days ago he and I met by chance in Water Street. It seemed to me that he looked very thin and sallow; and on inquiry I found that he had been struck down by fever a few weeks after reaching the Bonny River, and on his partial recovery, had at once been transferred to another ship that was about sailing for home. He is now, however, convalescent, and walking about with nothing to do. As he expressed himself as being tired of the sea and wanting some berth ashore, I offered him the post of second cashier in my counting-house, which just now happens to be vacant—but of course on probation. He was only too glad to accept the offer, and he started on his new duties this morning. He seems to be a young man of education and manners. What I have done for him so far has been out of regard to my brother's memory; if I find that he merits it on his own account, he will not find me neglectful of his interests.'

Miss Esholt took care to be present at the introduction of Wilmot Burrell to her brother's wife.

Wilmot had casually heard that Mr Esholt had been lately married, but had attached no importance to the fact, as being one that in no way concerned him. When, therefore, he followed Mr Esholt into the drawing-room on his arrival at The Hollies and was introduced to Agnes as 'my wife,' it was all he could do to keep back the cry of surprise which rose involuntarily to his lips. He bowed low, so as to hide his emotion, and held out his hand, but would not trust himself with even a word in reply. The keen eyes watching from the easy-chair saw Wilmot's quick startled look and the momentary contraction of his mouth, and could not help admiring his power of self-command. Agnes, who had been training herself, ever since she heard the news, to go through the ordeal with composure, hardly succeeded as well. Her cold trembling hand, her colourless cheeks, her unsteady voice, all betrayed the agitation of her mind. Not for

one moment did she venture to lift her eyes to his.

Miss Esholt received the young man graciously—and she could be very gracious when it suited her purpose to be so. She made him sit next her at dinner, and entered freely into conversation with him, endeavouring to discover the salient points of his character, adroitly leading back the conversation more than once, when it seemed inclined to go astray, to his early life and his long vacations at the vicarage, and all the surroundings of those pleasant days, but careful always to leave out Agnes's name, waiting, in fact, till Wilmot should introduce it of his own accord, which, however, he unaccountably failed to do. He had not spoken a score of sentences to Miss Esholt before something seemed to put him on his guard against her, and when he noticed the cold vindictive expression of her eyes as her glance followed Agnes about the room, he said to himself: 'This woman is her brother's wife's enemy. She's trying to draw me out for some purpose of her own. Gardez-vous, mon ami.'

Consequently, as it fell out, Miss Esholt's thirst for information—that is, for the information she was so desirous of getting at—was productive of little or no result. Wilmot was willing to talk and answer any number of questions about his life on board ship and his experiences on the coast of Africa, many of them very strange and startling; but when Miss Esholt, leading him by the hand, as it were, would strive to draw him skilfully back to where he felt the ice every moment growing thinner under him, he would burst abruptly away, glide lightly over the dangerous spot, and get back to safer ground as quickly as possible.

Agnes would have been more than woman if she could have kept her eyes from occasionally wandering in the direction of Wilmot, when she felt that his gaze was turned another way. It seemed to her that he had never looked so handsome as he looked to-night. His late illness had lent a touch of refinement to his features which gave him more the look of a hero than ever. His thick brown curls, among which her fingers had so often strayed, still clustered round his white forehead with the same apparent carelessness as of yore. She had often been struck with his likeness to a certain portrait of Lord Byron she had once seen: to-night she was more struck with it than ever. As her eyes glanced from Wilmot to her husband and then back again, a little sigh fluttered involuntarily from her lips.

Wilmot, for his part, was no less struck with the change in Agnes. He had left her a lovable and fascinating girl, a girl of whom he often thought with a sort of regretful tenderness, whom he would gladly have made his wife, had not Dame Fortune played her such a scurvy trick; he found her now a woman, as lovable still, no doubt, and equally fascinating, but with an indescribable charm about her which had never struck him before. Of what that charm consisted, he did not care to ask himself; it was enough for him to feel and know it was there. He went home that night a prey to a tumult of conflicting emotions—love, anger, mortification, and vain regrets. He felt that never in his life had he loved Agnes as he loved her now, when she was lost to him for ever.

That first visit of Wilmot to The Hollies was by no means his last. Mr Esholt generally brought him to dinner at least twice a week, and he had a standing invitation to drop in for an hour of an evening whenever he felt so disposed—an invitation of which he availed himself pretty frequently. He had lodgings about a mile and a half higher up the river, so that it was only a pleasant walk between his place and The Hollies. He was very cautious both as regards his speech and his demeanour on these occasions. He had formed such an opinion of Mr Esholt's keenness and clear-sightedness in business matters, that it seemed to him only a matter of course that he should bring the same qualities to bear in private life. Then, again, he felt that nothing he said or did remained unnoted by Miss Esholt's ever-vigilant eyes. That she had some hidden purpose of her own to serve, he felt sure, and not to know what that purpose was filled him with vague uneasiness. Such being the case, he was careful not to address Agnes oftener than ordinary politeness demanded; in fact, he rather overdid the part he had laid out for himself to play, and any casual observer would have set him down not as a person who had known Mrs Esholt from childhood, and had lived for months at a time under her father's roof, but as one who had made her acquaintance for the first time after her marriage. But Miss Esholt was not a casual observer, and she did not fail to note the brief, fiery glances, half-veiled though they were, which, despite the guard he had put upon himself, Wilmot could not help every now and then launching in the direction of Agnes; nor how he manoeuvred to sit near her, even though he did not speak to her; nor how he seemed to thrill if, in passing, her dress by accident chanced to brush against him. As for Agnes, she rarely spoke to him except when compelled to do so, but seemed to keep closer to her husband's side than at other times, and would sometimes feign a headache and make it an excuse for retiring while the evening was still young. At the best of times she had never a great deal of colour, but what she had, began to pale as the days went on, till little but the ghost of it was left.

'She can't deceive me,' said Miss Esholt grimly to herself, 'for all she tries to make one believe she has no more feeling than a statue. There has been more, far more, between those two than appears on the surface. Mr Burrell tries to hoodwink us all; but it's plain that he loves her; and as for madam, unless I'm much mistaken, she reciprocates the feeling, but is too frightened to let it be seen. And yet in Robert's mind there is not even the faintest suspicion groping its way towards daylight! Eyes hath he, and yet he sees not.'

Miss Esholt, considering in her own mind the state of affairs at the end of the third week after Wilmot Burrell's first appearance at The Hollies, found that matters did not progress so rapidly as it seemed to her that they ought to do; though in what way they fell short of her expectations she probably never cared to ask herself, or could have categorically explained, had she been called upon to do so. But she felt like a spectator of the first act of a comedy (might it not, perchance, develop into a tragedy by the time the last act was reached!) when the action flags, and one becomes impatient to get on

to the unknown something which one has a presentiment must surely come. *She* had a presentiment that there was an unknown something yet to come.

At this time Miss Esholt had only one friend staying with her at Syringa Cottage, a young lady, Miss Remington by name.

'Robert,' she said to her brother one evening, when Wilmot happened not to be there, 'Miss Remington has been dying to visit Rushmere Grange ever since she saw some drawings of it a month or two ago. I'm told it's only about a dozen miles away. Don't you think that she and I and Agnes might drive over some fine morning, explore the old place, have luncheon at the hotel, and come back in the cool of the afternoon?'

'Why not? I have no doubt you would find it a very enjoyable excursion.'

'But fancy three ladies and no gentlemen! Couldn't you manage to steal a day from business and go with us?'

Mr Esholt laughed, and shook his head. 'So that's your game, is it? No; I don't think you must count on me, charmed as, of course, I should be to join you.'

'I am quite sure you can spare a day if you only choose to do so. You are like the rest of the men, you fancy yourself of far more importance than you really are. Jabez Kimber would see that nothing went wrong during your absence, as he has had to do on many occasions already. You might also spare us Mr Burrell for the day. I am sure a holiday would do him good.'

'Oh, you shall have Burrell, and welcome; but as for myself'—

'If you can't go, Robert, I shall certainly prefer to stay at home,' broke in Agnes.

'In that case, there's no option left me in the matter,' answered Mr Esholt with an air of mock resignation.

Miss Esholt had half hoped that her brother would be unable to go, and there was still a chance that he might be detained at the last moment. What did she expect to gain, what end did she look to achieve by her little plot, which was purely an arrangement of her own?—for although Miss Remington had expressed a languid desire to visit Rushmere, she was certainly not 'dying' to do so. Probably she could not have told herself. But in the chapter of accidents there always lurk unnumbered possibilities.

Rushmere Grange dated from the reign of the Eighth Henry. His daughter, the great Elizabeth, was said to have 'trod a measure' there on one occasion with the Sir Godfrey of those days, who went far towards ruining himself in his efforts to do honour to the visit of his royal mistress. The place was now partly in ruins, and none of the family had lived there for many years. It was in charge of caretakers, whose duty it was to show visitors over such portions of the old mansion as were still in a tolerable state of preservation. Inside, there was little to see beyond the worm-eaten panelling of the walls, a few finely carved chimney-pieces, and some wonderful old tapestry, which had not been removed when the place was denuded of all else it contained. The gardens, however,

with their formal walks and pleached alleys, with their maze, their fountains, and their more or less dilapidated statues, were still carefully looked after, and in themselves alone were well worth a visit.

When the day of the excursion arrived, Mr Esholt, after a couple of hours at business, reached the starting-place by the appointed time, somewhat to his sister's secret chagrin. A roomy wagonette had been hired for the occasion. Wilnot perched himself aloft beside the driver, and was there allowed to smoke his cigar. He would have given something to know from whom his invitation had emanated—whether from Miss Esholt or from Agnes, for he did not doubt that it came from one or the other. In any case, should the Fates prove propitious, he would seize the opportunity for having that explanation with Agnes which hitherto it seemed to him she had studiously avoided.

For some time after they reached the Grange, it appeared as if the Fates were about to remain unpropitious. Agnes kept close to her husband, and evidently would not be drawn into a tête-à-tête. A Bath-chair had been provided for Miss Esholt's use, and Miss Remington as a matter of course kept by the side of her friend.

They had explored the house, and were now out in the grounds, wandering about at their own sweet will. Mr Esholt, Agnes, and Wilnot were walking a little way ahead of the others, when some thought seemed to strike Mr Esholt, and he turned back to speak to his sister. As he did so, a gentleman, accompanied by a youth with a sketch-book under his arm, emerged from a side-walk and came full upon him. The gentleman, a Mr Day, was well known to him on 'Change. There was a mutual laugh over the rencontre; then Mr Day—after having explained that the youth was his son, and that, having a mania for sketching, he would let his father have no rest till he had made some drawings of the Grange—button-holed Mr Esholt and drew him out of earshot of the others, after the manner of merchants in general and stock-brokers in particular.

Agnes and Wilnot strolled slowly on till they came to a point where the path they were following turned sharply to the left. Then Agnes paused and looked back. Her husband was still engaged with Mr Day; but Miss Esholt and her friend were following slowly on. When she turned, Wilnot had stepped round the corner to the left; after a moment's hesitation, she followed him. Even if her husband should be detained, Miss Esholt would turn the corner in another minute or two at most.

Wilnot saw that now or never was his opportunity. Not a moment must be lost. High privet hedges screened the walk on either hand; not a creature was in sight. But before he could make up his mind how to begin, Agnes said coldly: 'We had better go back; we are leaving the others behind.'

'Stay one moment, Agnes—Mrs Esholt—I entreat of you!' exclaimed Wilnot, with that indescribable thrill in his voice which moved her to-day even as it had been wont to move her of old.

'Well?' she said, confronting him with a steady gaze. She had felt for some time that

he had something to say to her, but hitherto she had carefully avoided affording him the required opportunity; now, however, she made up her mind on the spot to have the matter over and done with.

'Ah! Agnes, why are you so cold to me? why?—'

'You forget, Mr Burrell, that you are speaking to Mr Esholt's wife.'

'Pardon me if for one moment I forgot that fact—a fact which has burnt itself into my brain night and day ever since that moment when Mr Esholt introduced as his wife one whom, not three short years ago, I had every reason to hope I should some day call my own.'

'If this is all you have to say, Mr Burrell, we had better turn back at once.'

(To be continued.)

ASCENSION ISLAND.

THIS tiny oasis in the desert of waters of the South Atlantic Ocean will in future be less visited by British ships. The Admiralty have issued their ukase which declares that it is no longer to be used as a coaling station. Many of our men-of-war and mercantile ships and steamers will in future miss their Ascension coal and turtle. The island has been a royal naval station since 1820, previous to which date it had for some years been garrisoned as an outpost by a detachment from St Helena, more than seven hundred miles distant. When Napoleon was at St Helena, perhaps Ascension, so far as regards the strength of its garrison and the number of its inhabitants, was at its best, and a favourite rendezvous for the British squadron that kept watch and ward to prevent the 'Conqueror of Europe' repeating the episode of Elba.

Situated in latitude 7° 57' south, and longitude 14° 21' west of Greenwich, Ascension is about three thousand four hundred and fifty miles from England, and eight hundred and ninety miles from Africa. The island is barely eight miles long from east to west, and about seven miles wide from north to south. Though its general aspect is that of an extinct volcano crater, with ancient remains of lava, scoriae, and pumice-stone, it possesses one hill, styled the 'Green Mountain,' which rises to a height of nearly three thousand feet above the ocean, and is partly wooded and cultivated. In this equable climate, rightly deemed extremely salubrious, the Royal Naval Hospital, perched high up on the Green Mountain, has done much to alleviate the ills that poor Jack's flesh is heir to. Many a military and naval invalid, whose constitution has suffered under the torrid zone of the West African coast, especially the neighbourhood of Sierra Leone—aptly termed the 'White Man's Grave'—has derived great and lasting benefit from this sanatorium. The view of the sea of waters from its verandas is sublime, though unchangeable, except in the wild waves' play and the varied hues of sky and cloud. It is ever ranging between calm,

and convulsions in breeze and gales; apparently boundless and endless, as it rolls along with its loud or soft utterances day and night. The gardens of the hospital are pleasant places, where the convalescents finally build up their shattered constitutions. Though close to the equator, the climate of Ascension is so modified by the south-east trade-wind that the temperature rarely exceeds eighty-six degrees. One serious defect of this otherwise pleasant station is the limited water-supply, as there is but little rainfall during the year, and the spring-water is scanty.

The tiny village of Georgetown, containing about two hundred and fifty inhabitants, is governed by a post-captain of the navy. There are not many houses; but there is a small fort, also tanks, the coal-depot, and the naval store-houses. We hear that the inhabitants and the garrison are not only under naval discipline, but that the whole island is rated as a stationary vessel of Her Majesty's fleet.

Georgetown Bay can hardly be considered a harbour of refuge; there is neither a good pier, harbour, nor landing-place, and the ocean-swell and surf render landing in small boats an unpleasant proceeding. For the benefit of those who might fancy to visit Ascension, it is well to mention that they would have an opportunity of retirement from the busy world, and rarely be disturbed by letters or newspapers, and have the advantage of being able to constantly dine on turtle and turtle soup at small comparative cost. The hard-worked citizen would have ample opportunity to rest his racked brain in this isolated spot, amidst the great billows rolling in from the boundless ocean, that vast marine plain encircling the island. Any disturbance of the public health is to be feared only from external causes—quarantine stringency and modern sanitary appliances alike combine to keep Ascension healthy; and though the climate is naturally damp, from the limited extent of the island and the abundance of sea-air, it is alike equable and salubrious; and by avoiding the noonday sun and exercising some caution, many pleasant picnics and delightful excursions may be made. St Helena, the adjacent island, was specially reported on most favourably by a Committee of medical men before it was decided upon as the final prison and home of Napoleon I.

Huge turtle weighing from six hundred to eight hundred pounds visit Ascension between Christmas and midsummer, and lay their eggs in the sand. They are not permitted to return to their ocean home, but are turned, and placed in one of the numerous turtle ponds, from which they are sold to passing ships or steamers for two or three pounds, and form a welcome adjunct to the ships' 'grub.' Ascension as a rendezvous and depot for the British squadron has played an important part in putting down the slave-trade between the west coast of Africa and South America. The sailors and marines have done good service for many years in road-making, levelling ground, and laying out and keeping of gardens. It is to be feared the withdrawal of the post-captain and the little garrison is sure to be followed by an exodus of

the few inhabitants, and Ascension may then rapidly revert to its original primitive and chaotic condition, or be annexed by some other nation ambitious to possess such a haven in mid Atlantic, where the flag of Great Britain has long held undisputed supremacy, and brought to terms defiant slavers. Our squadrons of war-ships cruising in the South Atlantic will miss their pleasant visits to the island. The 'Home Gardens'—alike a favourite resort of the islanders and visitors—prove how the labours of the sailors and marines have made 'the desert to smile.' The pretty little cemetery of Green Mountain preaches short and pithy sermons to the visitors, reminding all that the prisoners rest there together, and hear not the voice of their oppressors. The tombstones and monuments are in keeping with the locality; possibly, there is some one in authority who, like the officers appointed in the ancient Grecian games, has power to pluck down statues and other erections in memory of the dead if they exceed due symmetry and proportion.

Ascension was discovered by the Portuguese navigator Juan de Nova on Ascension Day 1501, but it remained a desert island for many years. Its plains and tablelands range from one thousand two hundred and fifty to two thousand feet above the ocean. Large quantities of green vegetables are grown, and gladly bought up by passing ships. The little garrison at Georgetown is supplied with water from enormous cisterns capable of holding nearly two thousand tons of water, which is conducted through strong iron pipes laid from the Green Mountain springs, six miles distant. Geology indicates from the steep and rugged ravines intersecting some of the plains, which on the south coast undulate to the shore, and on the north terminate in precipices—coupled with the fact that the island is volcanic—that Ascension is a peak of a vast submarine ridge dividing the North and South Atlantic basins. The inhabitants easily procure abundance of fish, of excellent quality, close to the shore, such as rock-cod, conger-eels, the 'soldier,' &c. There are plenty of guinea-fowl, land-crabs, and a few wild goats. There are numerous small bays and coves along the coast where products of volcanic origin are found.

The sunrise witnessed from the Green Mountain is a wonderful picture, admitting of much dreamy sentiment. First, the tourist notices as far as the eye can view a boundless area of neutral tint; suddenly a tinted line gradually creeps over the eastern sky, but no sun is visible. The 'roseate hues of early dawn' rapidly advance; the sun slowly appears, and a wonderful bath of sunlight streams forth, converting the landscape into a scene of radiant splendour. At the exact commencement, the peak of the Green Mountain alone appears to be coloured by the sunlight, the ravines and plains still lying in gray shadow. A few 'rushing minutes,' and the illumination spreads with continuous speed over the whole island. Each nook, valley, and the encircling sea has caught the glory of advancing aurora. The day has begun with marvellous clearness in the bright sunlight and soft balmy air. The toil of the ascent and early watch is trivial when compared with the rich reward of scenic grandeur that is witnessed. The ascent can be made with compara-

tive ease; there is nothing to endanger life; perils and horrors are absent during the climb, and portentous tremblings of the earth are wanting in the extinct volcano.

A FAMILY SECRET.

CONCLUSION.

CHAPTER IV.—‘THE TIME HAS COME.’

AYNSLEY knew one friend of the late Dr Fairfax whose advice he thought might be useful to him in his present dilemma. That friend was Mr Hammond, who for more than half a century had practised as a solicitor in Yarmouth, and was the respected agent of some of the best families in the county. To him accordingly the doctor proceeded shortly after the departure of his visitor. As soon as he had explained the circumstances under which Mina had been found by the miller Suffling, and the substance of the conversation he had held with her that morning, the old lawyer looked grave and shook his head. ‘It was an unlucky day for the Chisholm family when the daughter of that bankrupt Irish lord became mistress of Broadmarsh,’ he said, taking a pinch of snuff reflectively.

‘But can you suggest, or do you suspect any reason for this vindictiveness towards her son’s wife?’

‘She is his wife, and that is reason enough for a lady of the Honourable Mrs Chisholm’s nature to dislike her,’ answered the lawyer, with a smile. ‘But, let me see.—There was something peculiar about the will,’ said Mr Hammond as he stepped towards a rack of deed-boxes and examined the names printed on them. ‘Here it is. The late Squire was most generous to his wife. He bequeathed to her the interest of twenty thousand pounds, and the use of Broadmarsh House with all that it contained during her life. He also left her the interest of fifteen thousand pounds until such time as his son George should marry and have a male child. On the birth of this prospective grandson, the interest of the fifteen thousand was to be withdrawn from the widow and allowed to accumulate for the benefit of the said grandson.’

‘Now I understand why the birth of Mina’s—I mean Mrs Chisholm’s baby was such a sore grievance,’ commented Aynsley.

‘Yes; and I confess that the news of his early death startled me with unpleasant suspicions, which, although lulled by the doctor’s formal certificate, are roused again by what you have told me.’

‘You do not mean that you think it possible there has been any’—

‘There, there, my good friend,’ Mr Hammond interrupted; ‘no man—and least of all a lawyer—has a right to publish mere suspicions. Enough to say that the grandson is dead, and the widow continues to enjoy the interest of the fifteen thousand until the birth of another male child.’

Mr Hammond went on to inform Aynsley that he had a sealed packet entrusted to him by Squire Chisholm eight or nine months before he died. ‘But what the packet contains,’ the lawyer went on, ‘I do not know. His instructions to me are

written outside with his own hand, and signed by three witnesses, including myself.’

‘What are the instructions?’

‘I do not suppose,’ observed Mr Hammond thoughtfully, ‘that I should be exceeding my duty in allowing you to read them.’ He again carefully perused what was written on the packet, and then said: ‘There—you may read, for I know my old friend Fairfax had a deep regard for you, and I look upon you as acting for his daughter as a brother might have done.’

Aynsley slowly and carefully read the instructions on the packet, and read them a second time, as if wishful to commit them to memory. He looked up with an expression of grave perplexity.

‘In what year was the late Squire married?’ queried Aynsley abruptly.

‘I cannot remember off-hand; but we can easily ascertain, if the date is of any importance to you.’

‘I begin to fancy it may be.’

‘The marriage was a very hurried affair, and Squire Chisholm’s long purse was freely drained to rescue the Irish lord and his family from absolute poverty.’

‘Where was the present George Chisholm born?’

‘In Paris, I believe. The Squire and his wife started for the Continent on the day of the wedding, and did not come home until three or four years afterwards.’

Aynsley rose and spoke with evident excitement: ‘I want you to allow me to make a copy of the instructions written on that packet, Mr Hammond.’

‘For what purpose?’

‘That I may show it to the Honourable Mrs Chisholm.’

‘The request is unusual, and I do not see how to comply with it.’

‘I will give you sufficient reasons for doing so.’

For another half-hour the lawyer and the doctor were in close consultation; and when the latter left the office, he carried with him a duly authenticated copy of what Squire Chisholm had written on the outside of the sealed packet. He went straight home. Biddy Flaherty, who had been prowling about for nearly two hours, saw him and felt relieved. ‘Now he has gone into his house, he can’t get out again without me seeing him,’ she thought; ‘an’ I’ll be after him whenever he goes, if it was to the end of the world.’

Aynsley received from his sister a list—a very brief list—of the callers for gratuitous consultation; and a still briefer list of patients who desired his attendance at their houses. They were two: one an old woman who lived in the Row which ran by the side of his house; the other was a shrimp-catcher in the same Row who had got himself badly pommelled in a drunken brawl. Neither case required immediate attention, so Aynsley told Jane he would go to them as soon as he found something he wanted from his bedroom.

In a corner beside the dressing-table was a strong sea-chest which had accompanied him all round the globe. Its chief contents now were old letters, diaries, and the uncompleted manuscript of a work which he hoped to get published some day, on the condition and treatment of emigrants

on board emigrant ships. He hastily examined the diaries until he found one dated eight years back. Then turning over the leaves, he stopped when he came to the name of Edward Fortescue, M.D. He read the paragraphs which followed the name, and as he read he became even more excited than when he had looked on the Squire's instructions on the packet in Mr Hammond's office.

'I have got it!' he exclaimed, with an expression of triumph and relief in his eyes.—'I may be late, Jane. Don't wait up for me. I shall go out by the side-door, as I must run down the Row to see those people, and I am in a hurry.' He went out by the side-door, and thus unconsciously escaped the attentions of Biddy Flaherty.

Having attended to his patients, Aynsley hurried to Suffling's mill. He had a pretty clear idea as to how he was to act now in order to place Mina in her proper position—he could not say restore her to it, since she had never held it at Broadmarsh. Everything, however, depended upon her strength; and he was rejoiced to find her much stronger than when he had last seen her. She had taken some of the beef-tea he left in the morning, and enjoyed another sound sleep. The feverish restlessness he dreaded had almost disappeared; and so, after beating about the bush for a few minutes, he ventured upon a direct question. 'You said that you did not expect Mr Chisholm back for a month. Did you make no attempt to communicate with him?'

'I had no opportunity. I wrote to him at the address he gave me, but I am sure my letters were not posted. When I knew that baby was dying, I implored Gedge to send a telegram, and he promised that he would do it. But even if he did contrive to send it away, it cannot have reached George, for—he loves me, and would have come at once when he learned that I so much wanted him.'

'I believe Gedge succeeded in despatching your message, and also that your husband received it.'

She started up in the bed, her eyes bright with the ecstasy of love which inspires new life.

'He has come back—and you know it!—Oh, bring him to me, and I shall be well!' she cried wildly.

'You must be calm, then, if I am to bring him to you,' said John Aynsley softly, and he was conscious of a distant craving in his heart for such a love as this woman had given to another. But he went on with brave unselfishness: 'You are right; he has returned, but it was early this morning, and he is so much fatigued that he is unable to leave his room.'

'Tell him that I am waiting for him—that I will die if he does not come,' she interrupted excitedly.

'I will go for him at once, and if he is able to move, he shall come. But you must promise to try to be quiet.'

'Yes, yes, I will be quiet till he comes,' she said, lying back on the pillow; 'but go at once. He will come when he knows where I am.'

Aynsley was not so confident of that, for the note of assignation with Blaxland was not yet explained.

'I am going to Broadmarsh now, and you may expect somebody here within an hour.'

He went out, and saw Joe Suffling standing on

the long ladder of his mill, gazing across the Denes towards the sea. He ran down the steps as soon as he saw the doctor.

'Look, sir,' he said in a flutter, 'd'yeow see that man without a hat? He have been a-wanderin' up an' down the denes an' the shore for more than an hour a-holding that rag in his hand, an' lookin' wild-like because he couldn't find something he wanted.'

'Who is he?'

'That be Master George—George Chisholm as belong to Broadmarsh.'

Aynsley darted out at the gate and across the Denes to the place where George Chisholm was wandering vaguely about, holding tightly in his hand a lady's handkerchief, which was soiled with sand and sea-water.

'I beg your pardon,' said Aynsley, halting in front of him; 'I believe you are Mr Chisholm of Broadmarsh?'

He was a sturdy and handsome fellow; but he looked distraught and dazed, with his bushy hair tossed and tangled by the wind. 'That is my name,' he answered shortly. 'What is yours, and what do you want with me?'

'Aynsley is my name, doctor of medicine by profession. I am surprised to find you here, for this morning I was told that you were too ill to leave your room or to see any stranger, although my business with you was most urgent.'

'I cannot talk with any one on business at present.'

He was striding hurriedly away. Aynsley saw that he must say something which would arrest the man's distracted attention. 'Mr Chisholm,' he said in a loud authoritative voice, 'I wish to speak to you about your wife.'

Chisholm halted, wheeled round unsteadily and glared at the speaker, who was again close in front of him. 'My wife!—I have no wife!' he exclaimed wildly, as he held up the handkerchief. 'See; this was hers—her name is on it—Mina. I found it on the sands, and she is drowned.'

'She is not drowned,' said the doctor reassuringly.

'Not drowned!—then she has gone away with' — He checked himself, and added gloomily: 'Then she has gone away, as my mother told me.'

'She has not gone away; but, despairing of your arrival, and driven frantic by circumstances which you will speedily learn if you will be calm, she fled from Broadmarsh, and in her frenzy I believe did mean to seek refuge there' (pointing to the sea); 'but Providence mercifully spared her from that crime. She is very ill, and longing only to see you.'

'Where is she? Where is she? Why did you not come to me at once with her message?'

'I have told you that I sought you, but was not allowed to see you.'

'Who that knew your message dared to prevent you?'

'Your mother. I explained everything to her, and still she refused.'

Chisholm staggered as if he had received a heavy blow on the chest. 'I know she does not care for Mina; but I did not think she would have done this,' he muttered feebly; and then with sudden energy, altogether oblivious to Blaxland's note, which had wrought so powerfully

upon him, he cried: 'But where is she? Where is my wife?'

The doctor laid a hand on his arm with a friendly grasp. 'She is up there in the miller's cottage. But before you see her, try to control yourself. The excitement of meeting you may prove too much for her.'

Aynsley took his arm and led him to the door of the cottage, the miller following at a little distance, wondering what new turn this queer business was to take.

Chisholm remained at the door whilst the doctor entered Mina's room. She was awake, and looked eagerly into his face. 'I have brought some one,' he began cautiously; but he was not allowed to proceed further.

'It is George—my husband!' she exclaimed excitedly. 'He has come—he has come!'

'Yes, my darling, I am here,' said Chisholm, bursting into the room; 'and God forgive me for my long neglect.'

There was a short hysterical cry of gladness, and husband and wife were clasped in each other's arms, whilst Aynsley quietly slipped out of the room, closing the door behind him.

An hour elapsed, and during that hour, a letter containing a long telegram was brought from Mr Hammond to the doctor, which the latter perused with evident satisfaction. Then he was called into the room by Chisholm, who looked pale but happy. There was a brief consultation, at the end of which Aynsley was empowered to proceed to Broadmarsh and explain to the Hon. Mrs Chisholm what had occurred, leaving her to make such arrangements as might be necessary for a separate establishment.

Joe Suffling harnessed his fast-trotting pony in the spring-cart and drove the doctor to Broadmarsh. His arrival before the return of the faithful Flaherty caused the Hon. Mrs Chisholm considerable surprise, but she entered the room in which he awaited her with a welcoming smile.

'I suppose you have come, doctor, to tell me that your patient is progressing favourably; and I am glad to say that you will soon have an opportunity of speaking to my son.'

'I have already had the satisfaction of speaking to your son, Mrs Chisholm, and I have now come to speak to you on matters so serious that I must ask you to give them your utmost attention.'

Unbidden, he seated himself at the table, and placed on it his old diary, open at the place in which lay the copy of the Squire's instructions, and the letter with telegram he had received from Mr Hammond whilst waiting at the mill.

'First, Mrs Chisholm, I wish you to understand that for the sake of your son'—he laid a curious emphasis on the word son—'and for the sake of his wife—as well as for your sake—I am anxious that as little as possible of the curious story which has come to my knowledge should be made public. It rests entirely with you whether or not it shall remain hidden.'

'I am still unable to comprehend,' she said with an effort to speak firmly.

'This is a copy of instructions written by the late Squire Chisholm outside a sealed packet which shortly before his death he entrusted to Mr Hammond, the solicitor who for many years managed all his legal affairs. Be good enough to read it carefully.'

She took the paper and read, her brows knitting more and more as she proceeded:

'This packet is only to be opened in the event of my wife, Elizabeth Balhooley, failing to fulfil the conditions on which I married her. These she knows, and they are fully explained in the document within. Should she in any way attempt to deprive my son, George Chisholm, of his property or to mar his happiness, the packet is to be opened, and the contents used as may be determined by legal authority. Should she die without any rupture between her and my son, Mr Hammond is on his own authority to destroy this packet by fire without opening it. My earnest prayer is that the contents may never be known to any one. GEORGE CHISHOLM.'

The names of the lawyer and two others were appended as witnesses to the Squire's signature.

'The packet has not been opened?' inquired the lady calmly.

'No.'

'Well, I should say it ought to be opened without waiting for the contingencies which my poor husband's imagination created. You ought to know that his intellect was much enfeebled for several years before he died; indeed, it never was very strong.'

'I do not think it should be opened,' said Aynsley very deliberately.

'Why should you say so, when you do not know what silly ravings it may contain?' she retorted, carelessly tossing the paper back to him.

'Because I know that it does not contain any ravings, but a statement of facts which—I think for every one's sake—having been so long kept in the dark, should not now be dragged into the light. A gentleman who knew you at Castle Blaney and in Paris was a friend of mine.'

'Impossible. No acquaintance of my family could be a friend of yours.'

'You are mistaken—his name is Dr Edward Fortescue.'

'Dr Fortescue—he is dead!' she gasped, her face turning yellow.

'Ah, I see you know him,' rejoined Aynsley with as near an approach to a sardonical smile as his kindly features could assume. 'No; he is not dead, I am glad to say; although at the time he told me the curious story of the hasty marriage of the Honourable Miss Balhooley and the birth of her son, I did not expect him to live more than a week.'

'What do you mean?' Her voice did not rise above a whisper and her eyes seemed starting from their sockets.

'You know that Dr Fortescue was a good-natured, careless fellow, and always impecunious. He had so much ability, that with only a little ballast he would have risen to a high place in his profession. Ill health compelled him to make a long sea-voyage, and he chose the ship *Hypatia*, bound for Melbourne, chiefly because I was the medical officer on board and his friend.'

'Well?' She took a soft handkerchief and wiped her lips, which were parched.

'Permit me to read a few extracts from my diary. The entry was made in June 1879, when we had been three weeks at sea. Listen!

'Fortescue has been to-day as indifferent as ever about the result of his illness, and talking much about his past career without more than a regretful smile at the opportunities he has allowed to slip by him. Amongst the stories he told me there was one which interested me much. He said that whilst in Paris in 1858 he was desperately hard up. He had borrowed from every one who would lend him a sou, and he had pawned everything which would pass for a coin at the humblest Mont de Piété. He was smoking the stump of his last cigar, and wondering how he could contrive to get a meal, when there was a knock at the door. He said "Come in," expecting to see the landlord or the concierge enter with a demand for payment of rent. But he saw a gentleman of middle age, in whom he recognised the wealthy Squire of Broadmarsh.

"You know me, Dr Fortescue?" said the visitor in a hesitating way, and it was clear that he was in a state of much nervous agitation.

"Of course I know you, Mr Chisholm, although we only met once at Castle Blaney. The way you carried off the Balhooley girl in a month and set the whole family on their feet again caused talk enough to make it impossible to forget you. That's nearly a year ago now.—Hope your lady is well?"

"Yes, she is—as well as can be expected. We learned a few weeks ago that you were in Paris, and I come to ask you in her name and my own to render us a service of the most vital importance to our future happiness."

"Only say what it is, and I'll do it," said Fortescue cheerily.

'The Squire became more nervous in his manner than before. Then, with an effort, he said firmly: "You are very kind, Dr Fortescue, and when you have heard me, I hope you will not refuse our request. But it is my duty to tell you that the service we require from you is of such a nature that it might injure your professional reputation if it ever became known."

Aynsley stopped reading and looked up. The Hon. Mrs Chisholm was now twisting her handkerchief viciously between her fingers, and there was a wild expression in her eyes which caused him some uneasiness.

'I think, madam,' he said, 'I can explain the rest more delicately and briefly in my own words than by reading this record. When it was written, I had no idea that I should ever have anything to do with the matter, and treated it in my diary as a curious story.'

'Go on,' she answered hoarsely.

'Then, madam, your husband told Fortescue that he had accepted the invitation to Castle Blaney in the hope of overcoming the gloom which possessed him by change and excitement. You observed his gloom, speedily won his confidence, and he told you the cause of his sorrow. He had loved a handsome peasant girl, but weak and cowardly fears of the ridicule of friends and neighbours made him hesitate to marry her. He blamed himself bitterly for this weakness; and when the girl gave birth to a son, he determined to repair the wrong he had done and marry her. But she died a fortnight after the child was born, and he was overwhelmed with remorse. He wished his son to be brought up as his heir, but

did not see how it could be done. You solved the difficulty.'

'Yes,' she murmured bitterly.

'You agreed to marry him at once and go abroad. After a due interval, you were to announce the birth of a son; and when you returned to England after a sufficient lapse of time to render the difference of age not easily perceived, the Squire's child passed as the one you were supposed to have borne. This you agreed to do on the condition that the Squire relieved your family from the absolute poverty into which they had fallen, and the further condition that his property should be equally divided amongst any children you might afterwards have.'

'Well?' she exclaimed fiercely. 'What then? Did I not make a sacrifice such as few women would make to gratify the whim of the man? Have I not kept the secret? Have I not fulfilled my part of the bargain? What harm have I done? Who is there that would not pity and sympathise with me rather than condemn me? Use the knowledge you have got of this family secret and who will suffer? Not I—but George—the husband of the woman you love!'

She thought that blow would silence him. Aynsley felt his cheeks tingle and his heart harden against the woman he had been inclined to pity in her discomfiture. He answered quietly: 'Yes, madam, I love Mrs Chisholm so respectfully that I remember she is the daughter of a dear friend and the wife of another man.'

'It is more than she remembered when, as this letter proves, she arranged to elope with her husband's pretended friend,' was the spiteful retort.

'You are altogether wrong on that point, I am glad to say. Here is a telegram from Mr Blaxland. Permit me to read it:

Never wrote one word to Mrs C. in my life. Note found is one addressed to Rhoda Hartford, which she lost at B. My journey to London is to arrange with her parents about our marriage, which comes off next month. Don't understand fuss, but will be down by last train. See you early to-morrow.

HENRY BLAXLAND.'

The Hon. Mrs Chisholm felt that the last support had snapped under her.

'How do I know that this is genuine?' she asked sulkily.

'You have only to await the arrival of Mr Blaxland, who will be accompanied by Miss Hartford, for a telegram requesting her presence has been despatched. Then it will be impossible to deny that the note you showed to me and to Mr George Chisholm, and which might have wrought so much harm, was one you filched from your niece's writing-case whilst she was staying here.'

'How do you know that?'

'Your question is a confession. I understand the whole position, and I respect your too great eagerness to assist and provide for your sisters and their offspring. Disappointed in not having children of your own, you were anxious to keep the lands of Broadmarsh in your family. Therefore you resolved that George should marry one of your nieces, and you thought Miss Hartford would be the most likely one to attract him.

Disappointed in that project, you hated the woman he chose for himself, and you cannot have entertained very tender feelings for him. But as your plans have failed, why not retire from Broadmarsh with your ample income, and save yourself the pain of coming in contact with people you do not like?

'I can keep them out of this!' she rejoined with a vicious gleam in her eyes.

'Very well, Mrs Chisholm; if you refuse to be guided by friendly advice, I will leave the matter entirely in the hands of Mr Hammond. Do you know what that will mean?'

'No; but it can be of no consequence to me.'

'I am afraid the consequences will be very serious to you. The sealed packet will be opened, and then your dead husband's words will make known to the world that not love for him or sympathy with him in his remorse, but a mere matter of money, induced you to enter into the conspiracy to pass off as your own the child of the woman he loved, and would have married had her life been spared. Then the false certificate of birth may involve you in some difficulty with the French authorities. Even if you escape imprisonment, you will be shunned by the society you enjoy so much. Probably, there would also be a post-mortem examination of the body of the child now lying in this house, when the interest you had in his death became known'—

'You dare not hint that I caused it,' she interrupted fiercely, but evidently alarmed.

'I have no doubt that the coroner's verdict would be—"death from natural causes;" but the result of the inquest would leave suspicion of you for ever in the public mind. Now, George Chisholm—who has authorised me to speak in his name—wishes you to be protected from all reproach. What he might wish if he knew the whole story, and that you were not his mother, I cannot say.'

'What would you have me do?' she asked with a sullen scowl at his calm face.

'Be wise, and take the course which will permit the whole of this miserable business to pass into oblivion. Go to London. Live there in peace amongst your numerous relatives and friends, and leave the young people here in peace. No one shall ever know the family secret, unless you force me or Mr Hammond to speak.'

She was conquered. That night she left Broadmarsh accompanied by Biddy Flaherty, who had returned to her mistress after finding, on inquiry, that Dr Aynsley had left his house hours before and would not be home till late.

The Hon. Mrs Chisholm did not see her niece Rhoda, and did not live to attend her wedding, for she was found dead in her chair on the sixth morning after she left Broadmarsh. The physician who was called in pronounced heart-disease to be the cause of the sudden death. Her will left everything it was in her power to bequeath to her sisters, nieces, and nephews in equal proportions. The name of George Chisholm was not mentioned. The latter with his wife returned to Broadmarsh; and after the funeral of their child, Mina slowly recovered health and strength under the careful attention she now received. Joe Suffling and Nan were well rewarded for their kindness to her; and they

both had good reason to think of that moonlight night when the black figure appeared on the Denes as the turning-point in their luck.

Mr Hammond duly burned Squire Chisholm's packet on the death of the widow; and at the same time John Aynsley destroyed all the portions of his diary relating to the Chisholms. So every proof of the family secret disappeared, and the Squire of Broadmarsh will never know that the Hon. Mrs Chisholm was not his mother.

She was buried in the family vault of the old church of Sandybeach; and as Aynsley turned away from the tomb, he thus charitably summed up the character of the deceased: 'The poor woman was insane in her desire to exalt and support her impoverished family.'

NEWS-TRANSMISSION FIFTY YEARS AGO.

THE following somewhat suggestive passage recently attracted our attention while we were reading an article on the 'Pre-eminent Power and Greatness of Britain' in the *Monthly Review* for 1826: 'A newspaper published in the morning in London is by the same night read a hundred and twenty miles off! The twopenny post revenue of London alone is said to equal the whole post-office revenue of France! The traveller going at night from London, sleeps on the second night four hundred miles off!'

We smile nowadays at the facts which appeared so startling to our fathers, and can well afford to let them enjoy their satisfaction without any feeling of envy, when we remember our own advantages. It was with no intention, however, of instituting any comparison between the past and the present that we have introduced the foregoing extract, but because it recalled to our mind a curious incident in the old days of reporting, which occurred some four or five years after the date of that passage. The circumstance we are about to relate was considered, in the era before railways were in existence and telegraphy was as yet undreamed of, a very remarkable instance of rapid reporting; indeed, it completely mystified even those connected with the then existing means for the transmission of news, and continued a problem for some time to those initiated in the ordinary work of journalists. It is from the unpublished notes of the gentleman who had the chief arrangement of the details of the matter that we take the following circumstances.

The undertaking in question was in connection with a famous banquet given at Glasgow more than fifty years ago, and which was convened for resuscitating the old Tory party, supposed to have been annihilated by the passing of the Reform Act. A memorable speech by Sir Robert Peel was anticipated as the great event of the occasion, every word of which would be eagerly read, and the first report of which it was necessary to strain every available resource to secure. The banquet at Glasgow took place on a Friday, and was not over until two o'clock on the Saturday morning; yet—and this is the startling feature which so astonished newspaper readers of that day—in a second edition of the Saturday issue of the *Morning Herald*—which edition was circulated over Great Britain and Ireland early the following

Monday—there was a report of the proceedings at Glasgow, with Peel's speech in full!

One incident alone is sufficient to show how taken by surprise everybody was at this astonishing instance of newspaper enterprise. Sir Robert Peel, after leaving Glasgow, proceeded to Netherby, and remained with Sir James Graham until Sunday morning. On that day, having important business to attend to, he left for the south. The open carriage in which he travelled stopped at the *King's Arms* at Kendal to change horses. The landlord of the inn had been told previously to hand Sir Robert a paper containing the proceedings at the banquet; and there were anxious eyes on the watch from the first-floor windows of the hostelry to note what effect the circumstance of so unprecedentedly early a report would produce upon his mind. He at first refused the paper; but on being told that there was a full report of the Glasgow demonstration in it, eagerly seized it, with at the same time an incredulous look. When, however, he saw in a Saturday's paper, published in London, his own speech verbatim, he was fairly astonished. There was no mistake about it, and leaning back in the carriage, he commenced reading it as, the horses being now changed, the journey was resumed southward.

How had it been possible under the then existing means of transit to secure a report of a speech made in Glasgow late on Friday night, in a London newspaper issued on the following Saturday, and circulated in Westmoreland on the Sunday morning after?

In order to appreciate the difficulties of the achievement, it is necessary that the reader should carry himself back to the period when it was effected. In those days, there being no railways or telegraphy, of course whatever was to be done in the way of rapid communication had to be done by the means of horse-flesh. It must also be borne in mind that Glasgow is four hundred miles from London. The second edition of the *Morning Herald* of Saturday, containing the report of the meeting held in Glasgow on Friday night, was in that town by six o'clock on the Monday morning following, thus accomplishing eight hundred miles in little over fifty hours, besides allowing time for writing and composing six columns of matter. Here was an apparent impossibility; and looking at the matter from one point of view, well might the sturdy natives of Yorkshire maintain that it was all a hoax, and that 'horse-flesh could not do it.' But what horse-flesh could not accomplish, a little ingenuity and arrangement, however, successfully effected.

It was, first of all, arranged to print a large number of Saturday's first edition of the *Morning Herald* with one page blank. There was at the time a coach, called the 'Manchester Telegraph,' which left the *Belle Sauvage*, Ludgate Hill, every morning at half-past five o'clock. This coach ran at the rate of twelve to thirteen miles an hour, and reached Manchester the same night. By this coach the papers were so far transmitted. An agent was awaiting the arrival of the coach at Manchester, and then carried the papers by post-chaise on to Kendal, which was reached early on Sunday morning. Here everything was in readiness for printing off the page left blank. The gentlemen who had been sent to represent the

Morning Herald at the banquet had arrived from Glasgow in Kendal on Saturday evening. Arrangements had previously been made with the printers of the *Kendal Mercury* for the use of their office; and the report of the meeting at Glasgow was set up and ready for press before the arrival of the partially printed papers from London early on the Sunday morning. Consequently, a report of the Friday evening's proceedings at Glasgow was in circulation in Kendal when Sir Robert Peel arrived there at mid-day on Sunday.

It might well seem marvellous to the residents of the north of England, in those days, before the era of electricity or steam, to have a London Saturday paper circulating in their midst before one o'clock on Sunday, containing a lengthy report of a dinner which had taken place at Glasgow on the previous Friday night! Not a single detail of the arrangements had failed; and the result was a complete success. The distribution of the copies over the whole kingdom was carried out with the same happy result; and early on Monday morning, when its contemporaries were being published in London only, the *Morning Herald* was circulating in all parts of Great Britain and Ireland. An apparent impossibility had been accomplished; and the '*Herald Express*' continued for some time to puzzle and excite the wonder of newspaper readers.

THE MONTH: SCIENCE AND ARTS.

IN testing the new rifle at Aldershot lately, the telephone was used as a means of communication between the marksmen and the markers at the butts. That such an innovation was necessary may be judged by the fact that the range of the new weapon varied during the trials from one mile to a mile and a half. It is the confident belief among those who ought to know, that when this new Magazine Rifle is served out to our troops, the English soldier will possess the most perfect arm of precision which it is at present possible to produce. It is, however, in the nature of things that by the time the army is fully provided for, a more perfect rifle will have been invented.

The *Scientific American* describes and illustrates a new form of bridge which it is proposed to erect across the river Bilbao, in Spain. This erection consists of a suspension bridge of light construction, which is supported from piers of such an elevation that high-masted vessels can easily pass beneath. Hanging from this bridge is a movable floor, the chains by which it is hung being so long that the floor itself is little above the water-level. This floor is pulled to and fro across the stream by suitable gearing, and acts in reality as a kind of travelling carriage for the conveyance of passengers and vehicles from bank to bank.

According to the North China *Herald* the yellow man is chiefly distinguished from his European brother by an entire absence of what in common parlance are known as 'nerves.' He can go through the most tedious and monotonous work from hour to hour and from day to day with no more sense of weariness or irritation than

if he were a machine. And this is characteristic of the young people as well as those of older growth, the boys being so good and tractable that they will plod away at their lessons without any feverish longings after the delights of play. The Chinaman can do without exercise or recreation of any kind. He can also sleep under conditions which would tax a European to the utmost: on a chair, a wheelbarrow, or on the floor, amid the rattle of machinery or the squalling of children, all is the same to him; nothing worries him. It may be this indifference to things that try the patience and temper of ordinary workers, which makes him so formidable a competitor in the labour markets of a not inconsiderable portion of the world.

The Monument on Fish Street Hill, erected by Wren to commemorate the Great Fire of London, which commenced its ravages not far from that spot, has lately shown signs of disintegration, pieces of stonework having fallen into the street below to the great alarm of the passers-by. It is satisfactory to learn that the injury to the structure is not of a serious nature, and that the column still remains as firmly fixed on its foundations, in spite of the near proximity of the Underground Railway, as it did when first built by its great architect. The limestone of which the Monument is built is continually acted upon by the acid vapours which contaminate the atmosphere of the great city, a condition of things non-existent in Wren's time. From this circumstance modern architects can learn a useful lesson, and should be careful to choose a stone for buildings in large cities or manufacturing districts which will resist the chemical action referred to.

Popular fallacies die hard, and one which seems to have the greatest amount of vitality is the old, old story of the toad in the rock. This notion that toads have been found alive in solid blocks of stone is one which has crept into many books, and is still occasionally revived as a thing to be believed in. Such an event has, according to a correspondent of the *Times*, lately happened at Greenock, the imprisoned toad having been found in a bed of clay, and supposed by the finder to have remained in that deposit since prehistoric times. More than fifty years ago, when this superstition regarding toads was common, Dean Buckland determined to set the matter at rest by crucial experiments. He caused several toads to be imprisoned in cells cut out from blocks of stone, which cells were firmly closed and the blocks buried for a period of several days. He also enclosed living toads in holes cut in trees; while some others he confined in plaster receptacles. After-examination showed that the majority of the creatures were dead; the others who retained life quickly succumbing to a subsequent short period of confinement.

Mr J. Johnson's 'Eclipse Life-belt' is a distinct improvement upon the perishable rubber variety and the cumbersome cork jacket used by life-boat crews. It consists of twenty corrugated metal tubes joined together with durable webbing, the tubes being placed vertically on the chest and back. This contrivance more than fulfils the Board of Trade requirement as to buoyancy—namely, twenty-five pounds in salt water, for it possesses a supporting power of thirty-two pounds in fresh water. The belt can also be adapted to

the side of a ship's boat, which can thus be readily made unsinkable. The inventor's address is 16 Dyott Street, London.

A novel form of steam-boiler, which is said to be quite non-explosive, has been invented by Messrs Serpollet of Paris, and is fully described in the pages of *La Nature*. It consists of a thick steel tube, which is flattened under heat and pressure until its central opening is represented by a line scarcely a hairbreadth in thickness. One end of this tube is connected with a pump worked by a small motor, which introduces the necessary water; the other end of the tube serving as the outlet for the steam. The tube is preferably wound into a coil, so that when fitted on to a furnace it will become uniformly heated. Directly the water is introduced, it is turned into vapour, and the steam is turned off by simply stopping the water-supply. The apparatus is of the simplest construction, and does not need the addition of a safety-valve, governor, gauge, or any of those adjuncts which make an ordinary steam-engine so expensive.

The annual Exhibition of the Photographic Society of Great Britain, which lately took place in London, did not bring forward any startling novelty either in the way of apparatus or process. But there was indicated by the pictures hung on the walls the wide acceptance by photographers of the comparatively new method of printing in salts of platinum instead of those of silver. Platinum gives a black-toned picture with a dull surface, which is far more artistic than the brown and purple tones with shiny surface which is associated with silver-printing. The platinum has the further merit of absolute permanency, so that it takes away from the photographic image its old reproach of being apt to fade. A recent modification in the platinum process has made its practice far more simple than it used to be, and this circumstance coupled with the advantages just pointed out will be sure to increase its votaries.

Alarm has again been occasioned by fresh subsidences in the Cheshire salt district, and at Northwich the *Wheatsheaf Inn*, a modern building, has collapsed to such an extent that it has had to be demolished. The inhabitants of the district naturally complain that they must see their property submerged and destroyed without any compensation; for although the ruin is attributable to the salt-works, the damage is so universal that it cannot be brought home to any individual worker. The subsidence is caused by pumping up the brine which is due to the melting of the rock-salt far below the surface. As this brine is removed, fresh water takes its place, to react upon the rocks until it is itself transformed to brine. And so the process goes on year after year, the very props of the earth being constantly removed. It has been suggested that the great Salt Syndicate, of which we have all recently heard so much, will constitute a distinct ownership, against which the injured ones may proceed with some hopes of pecuniary compensation for their losses.

At the Lambeth works of Messrs Brin, a practical demonstration was recently given of the direct conversion of iron into steel containing two per cent. of aluminium, a new process, which seems as promising as it is simple. The charge

consisted of about forty pounds of broken cast-iron, which was smeared with clay—the source of the aluminium—and a special flux. This charge was placed in a small foundry-furnace, and was speedily transformed into excellent steel. It is said that other metals can be similarly treated, and that any percentage of aluminium can be alloyed with them in the simple manner described. The plating of iron with aluminium by means of the blowpipe was also shown on the same occasion. It will be remembered that aluminium is a white metal which makes very valuable alloys with other metals, its cost of production hitherto limiting its use. It has gradually been getting cheaper, and this new process will most surely cause it to come into more common use than heretofore.

Remains of old Roman plank-roads have been found on a moor in Lower Hanover, and have been subjected to careful examination by order of the Prussian Minister of Education. Two parallel plank-roads were found to exist on the moor; but whilst one had been almost destroyed, evidently by force, the other showed distinct signs that it had been repaired during the Roman period; for in this latter case, boards had been fastened over the original planks, the fashion of the woodwork being carefully preserved.

The explosion of a petroleum vessel in Calais harbour calls attention to a new danger which menaces every place between which such vessels ply. So long as their tanks are full of oil, there is little danger, for there is no room for the explosive mixture of petroleum vapour and air to form. It is when the tanks have been emptied of their freight that danger arises. People *will* go into a gas-laden atmosphere and conduct their investigation with the aid of a naked light. There is little doubt that the Calais explosion was caused by this strange want of ordinary prudence. Now that the use of petroleum is so common as an illuminant, it behoves the government to take steps to place its use under some kind of legislative control; and this does not apply only to its transport, but to its daily use; for it is a fact that in the United Kingdom nearly three hundred lives are lost through the explosion of ill-constructed paraffin lamps. This is about double the number who fall victims to accidents in our mines. A government measure to deal with the important subject has long been talked about, but it has not yet reached the active stage.

A curious illustration of the perfection of our present method of railway-coupling and brake-operation is afforded by an incident which occurred on the Metropolitan Underground Railway a short time since. It will be remembered that this railway since its completion describes a complete circle round London, so that, on finishing its journey, a train comes back to the same station from which it started. It so happened that a passenger by one of these trains dropped a valuable ring as he left the carriage; but search upon the line failed to recover it. More than an hour afterwards the same train came into the station after having completed its circuit round London, when the ring was found upon the footboard where it had originally fallen. The vibration of the train during its long journey had not been sufficient to dislodge it from its position.

An ingenious method of detecting leaks in a ship has been devised by a Norwegian engineer; but, unfortunately, the method is only applicable to a vessel while in dry dock. A special form of furnace is employed, which is placed on the deck of the vessel, and in which a quantity of bramble or other material which will emit much smoke is burnt. This smoke is forced by means of a blower into the ship, the hatches and other openings having in the meantime been closed, and in a short time any leaks will be discovered by the smoke escaping from them. The time occupied in discovering a leak by this novel method is estimated at from thirty to forty minutes; but it naturally varies with the size of the ship under treatment. The cost of the test is about fourpence per ton.

A new substance which can be used for various purposes, and which can be kneaded while hot, or turned, bored, and otherwise manipulated when cold, is named Poteline, after Potel, its inventor. It is a mixture of gelatine, glycerine, and tannin, to which have been added zinc-white, sulphate of barium, or some similar earth. It can be coloured by the addition of any desired pigment. The proportions of its constituents vary with the use to which it is applied; thus, for sealing bottles, it must be used in the liquid state, and its solid constituents are reduced accordingly.

Many attempts have been made to construct a machine which shall effectually deal with the fibre of the Rhea or Ramie plant, a fibre of such length, strength, and lustre that it is particularly valuable in textile manufactures. The Indian government has twice offered a prize of five thousand pounds for a machine which shall accomplish the work required—namely, the separation of the fibre from the gummy matter and wood with which it is associated, and render it fit for the spinner. This prize has never been won. The French government, too, have offered a sum of money to be competed for in a similar way, and this prize also has yet to be awarded. Mr J. O. Wallace, who was recently exhibiting a Flax-scutching Machine at the Irish Exhibition in London, believes that he sees his way to solving the problem by a modification of his Flax Machine; and the way in which it deals with specimens of Rhea submitted to it shows that although this machine is constructed for another purpose, his hopes of success are well founded. The benefit to the textile trade which would accrue from this conquest of a long-known difficulty would be enormous.

The question of the probable existence of coal under London or in its vicinity is one which has for some time engaged the attention of geologists, many believing that the South Wales coalfield and that of Bristol may be connected by an intermediate link in the Thames Valley with the coal-measures of Belgium and Northern France. Mr Whittaker, who brought before the late meeting of the British Association at Bath an account of a deep boring which has recently been made in South London for the purpose of finding water, urges that this enterprise having failed, the boring might be used for settling the vexed question of the existence of coal in that neighbourhood. The boring in question has reached a depth of about eleven hundred feet, and it is urged that, now that the machinery is on the spot, the expense of

continuing the work would not be great, and could easily be met out of the government grant administered by the Royal Society. The discovery of coal would no doubt be interesting, and of great importance to Londoners in cheapening one of the first necessities of life. But would they not pay rather dearly for it, after all? Cheap coal in London would mean the establishment of iron-works and all kinds of factories in its pleasant suburbs, until the metropolitan area would rival the Black Country in its gloom and hideousness.

An Electrical Shoal-water Indicator has been devised by two Mexican inventors. It consists of a strong cylinder filled with shot, so that when hung by a cable from a ship it will remain perfectly upright in the water. Embedded in its centre is a glass or vulcanite tube half full of mercury, the two ends being closed by metallic plates, which are in communication, by insulated wires carried by the cable, with an electric battery and bell on the deck of the ship. The action of the apparatus is as follows: When the vessel approaches shallow water, the cylinder drags on the ground below, and is consequently no longer upright, but is thrown on its side. This causes the mercury in the tube to touch both the metallic plates attached to that tube, as above explained; the electrical circuit thus becomes complete, and the warning bell on the ship instantly rings.

It is stated that the sea-serpent was distinctly seen in Georgetown harbour on the 20th of last August, and that a tug named *Henry Buck* passed within two hundred yards of the monster. The creature is described as being about as thick as a flour-barrel, and appeared to be sleeping or resting on the surface of the water, until the near approach of the tug caused it to throw about fifteen feet of its tail into the air, to lash the water into foam and to swim rapidly away. It is believed that the monster cannot get out of the harbour, and that the expedition which was quickly organised to search for it will settle once and for all a question which has perplexed men for many ages. The account given is circumstantial enough, but not more so than many a description previously published by eye-witnesses. We hope to hear more of it.

According to recently published accounts, the lemon industry of Sicily is threatened with extinction, owing principally to the circumstance that one of its best customers, America, is now supplying herself with the coveted fruit. Lemon-growing in Florida is, it would seem, a most profitable industry; for a grove of young trees costing each about three shillings will in four years' time produce a crop of fruit selling for sixty pounds per acre, increasing regularly, until, at the end of ten years, ten times that amount will be netted from each acre of lemon-trees. The planters find that the richer soil is so productive that it is not an uncommon thing to find a single tree loaded with from four to five thousand lemons, each one being of a pound-weight. It is curious to note that this large-sized fruit is not saleable, for the very ludicrous reason that it is too big to fit the common American lemon-squeezers; so the lemon-trees are being now planted on poorer soil, so that the exuberance of their growth may be checked.

THE BLACKSMITH AND THE DAISY.

Among the daisies she nestled down,
And plucking one tiny bud,
She peeped through her lashes of hazel brown
At its beautiful crimson hood.
Then shaking the dew from its bonny head,
She lifted it up to her lips,
And whispered his name with a cheek as red
As the bloom on its fragrant tips.

'I love, I love!' and her voice grew bland
As the breeze from the gentle south;
'I love, I love!'—but a strong brown hand
Was laid on her smiling mouth.
'You love, you love!' and the brown hand twined
Through the waves of her sunny hair;
'They love, they love!' sang the tell-tale wind,
Through the locks of the whispering pair.

The shy wee daisy was borne away
From the fluttering girlish breast,
And the rough smith smiled as it coyly lay
In the crease of his open vest,
As though it were gracing the loneliest place
In the forge where he gaily toiled;
It smiled through the smoke with its sweet round face,
Till its leaves were all smeared and soiled.

Up went his sledge with a right good-will,
Then down with a merry clang;
Louder, and louder, and louder still,
As he whistled the tunes she sang.
He tossed his crisp locks as he fondly cried:
'How happy this toiling will be,
When you, love, are tending our own ingle-side,
And waiting, my darling, for me!

'Through the lights and shadows of forty years
I see you with wrinkled brow;
Ah, lovelier far! though your face appears
More grave and more thoughtful than now.
I steal to the window, and softly tap,
While you smile in your low rush-chair,
In your modest kerchief, your snow-white cap,
And your halo of dear gray hair.'

A rush of wind, and the daisy lay
'Mid the dust on the smithy floor,
Never to welcome the soft-eyed day,
Or the song of the blackbird more.
But the blacksmith lifted the faded thing,
Saying: 'Little I thought that this,
The most common flower of the field, could bring
Such a vision of perfect bliss.'

FANNY FORRESTER.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

HOW TO BE HAPPY.

'GIVE us, O give us the man who sings at his work,' says Carlyle. 'Be his occupation what it may, he is equal to any of those who follow the same pursuit in silent sullenness. He will do more in the same time—he will do it better—he will persevere longer. Wondrous is the strength of cheerfulness, altogether past calculation its powers of endurance. Efforts to be permanently useful, must be uniformly joyous—a spirit all sunshine—graceful from very gladness—beautiful because bright.' It is the old story :

A merry heart goes all the day,
Your sad tires in a mile-a !

It is easy enough to have this 'merry heart' when all goes well. But to keep it through all the ups and downs of this changeable world—that is the triumph. Yet our happiness is greatly in our own hands : and on the cultivation of the cheery spirit depends our usefulness to others.

But troubles are so heavy, some will say ; it is impossible to keep up. Even so ; let them lay us down, let them flatten us out like the grass under a garden roller. We can stand up afterwards humbly, as the grass does, and make the world fresher and brighter that we are still alive.

About being killed by troubles, old Dr Johnson once said a queer thing. He heard of Lady Somebody-or-other who was left a widow and died of a broken heart ; and he said if she had been a poor woman with nine children she would have been still alive. The case would have been worse, but the end would have been better. He knew enough of human nature to know that occupation is strength, and that we shall outlive Fortune's worst if we live for others.

We are dealing, however, not with great griefs, which must have their season, but with human unhappiness in general. It is neither affliction nor hardship that keeps most men and women unhappy. The game is not worth the candle, they say, when nothing troubles them except the

burden of themselves. The cultured ask, 'Is life worth living?' The rich and educated have imported the word *ennui* for their own exclusive use. Edwin has no misfortune to bear when he is in 'the blues ;' what Angelina calls 'the dumps' is a malady without known cause. The same Angelina's father has a balance at his banker's, when he feels life a bore ; and Angelina's mother has all she can wish for, when she is 'so low to-day.' To some people, as to the poet Cowper, it becomes a lifelong affliction to have no joy. Intellectual men are specially subject to it ; hence the ravings of the poets—which they might well have spared the world. Sensitive, highly strung, nervous natures, with the greatest capacity for happiness, have also the keenest sense of the want of it. Even the power of amusing others seems to be no safeguard for a man's own cheerfulness. We all know the story of the doctor advising his patient to cheer himself up by going to see Grimaldi the clown, and the patient saying : 'Sir, I am that unhappy man.'

The close union of mind and body is shown above all things in this—that sadness may be caused by disease, but it may also produce several different diseases. Illness and melancholy seem to work in a circle. It is the doctor's best hope that his patient will make a mechanical effort of cheerfulness and courage, and then in many cases of illness the charmed circle is broken, health returns, and the cheerfulness that was assumed soon becomes real and true by habit. Mark Tapley, we may be sure, did not suffer from 'nerves ;' and very few people do, who have formed the custom of looking at the bright side of everything and despising small worries. On the other hand, a healthy cheerfulness is more difficult for some men than for others. *Punch* was right in answering, 'Is life worth living?' by saying it depended on the liver—a pun perfect enough to make Charles Lamb turn in his grave.

But suppose there is health and still not happiness, what are we to think—dealing as we are, all the time, with the discontent of those who are free from acute discomfort—the form of

unhappiness that overclouds countless lives? We are to think simply that they have not learned how to be happy.

It does not depend on the wisdom of books; it is a practical matter, of which learned men are often profoundly ignorant. In what the boys call a stiff exam., with happiness for the subject, the great thinkers would nearly all be plucked. Carlyle said some good things about it, but gave no recipe for making it. He said that if the nations combined to make one shoeblack happy, they would fail; for if they gave him half the world, he would begin to want the other half. He said likewise, that if but one precious thing were taken away from what we possess, we should know *then* how happy we had been. But all the same he did not tell us how to be happy. Matthew Arnold defined happiness as a sense of hitting the mark; but where is the mark all along life's way, and how are we to hit it? Another great thinker said he despaired of being happy since 'there is no happiness for the gifted.' The lament reminds one of the comic woodcut of the 'sensitive plant'—the Professor at the piano weeping over his own music, while the company sit waiting for him to go on. The 'gifted' thinker argued that happiness diminishes as intelligence increases: that the cow in the meadow may be happy, but not the man. This theory is a favourite one because it is flattering; but it is forgotten that the highest capacity for pain is also the highest capacity for enjoyment. The cow in the field can eat grass and lie upon it, and feel the freshness of the day, and there its comfort ends. But who can count or measure the variety of joys any one of us thankless mortals has already received? Who can describe our capacity for happiness? As the starlit heavens are to our finite vision, it seems to go very near the infinite.

Ah! say the thinkers of discontented thoughts, that is precisely the reason why we suffer. The cattle know of no pleasure beyond eating grass; but we are conscious of an infinite craving. The more we have, if we get but leisure to rest and reflect, the greater is our hunger. When we toil up mountains from summit to summit, there is always a higher summit that no man has trod, and we are not one inch nearer its mists and clouds. Even when we make our home, and kindle fire upon the hearth, and gather our unbroken circle round it, there is a sense of incompleteness. There is a nameless, formless Something wanting, which cannot be got for love or money, nor for toil and time and tears.

Certainly, this is true. The infinite craving is the promise of our immortality. We should not wish to lose it. As George MacDonald has beautifully put it, there will yet come a moment of surprised recognition in which we shall exclaim: 'This was what it meant.'

Still, though perfect happiness is not meant for

us here, we were meant to be far happier than we let ourselves be. As Mrs Browning has it:

Methinks we do as fretful children do,
Leaning their faces on the window-pane,
To sigh the glass dim with their own breath's stain,
And shut the sky and landscape from their view.

We all have our own sky and landscape, if we will not fret to see something else. In Mr Ruskin's newly edited *Christ's Folk in the Apennine*, there is a beautiful thought by a peasant. This Tuscan countrywoman said there was no reason why each of us should not have *two paradises*—one in this world, and one in the next; and 'as for myself,' she added, 'I trust in my Lord about everything, and I think that is why I get on so well.' In a word, because we cannot have the perfection of happiness, there is no reason why we should not be patiently happy each in our place, a light and a strength and a pleasure to the corners of the world where our lot is cast.

But how? comes the repeated question. Oh that there were some recipe for happiness in the Household books! There is 'How to make Claret-cup' and 'How to remove Stains from Marble;' but not that simplest most necessary recipe, 'How to be Happy.'

The best directions would be: 'Keep an even mind, and carry about with you the philosopher's stone (or the modern equivalent for it) to turn common things to gold.' This needs an explanation, or it might be like a certain recipe which is of no use to the public, because it begins by requiring 'crumbblions' of a fine purple colour.

Evenness of mind, to the sensitive nervous temperament, depends very much upon order. Regular hours of rising and of sleep: a certain broad order of duties in the day, to prevent hurry, and to give the sense of rest that comes of duty done—not many things undertaken, but few and finished; this is part of the self-discipline that contentment depends on. Secondly, beside order of time, visible order is a great help—neatness of person, and a home with the proverbial 'place for everything and everything in its place,' or rather restored to its place on the old-fashioned principle of clearing as we go. Visible order in its highest degree becomes visible beauty—the home full of brightness and good taste, the face and dress and bearing as pleasing as care can make them. All this outward order is a tonic for the mind. Thirdly, if we do not cultivate the power of silence at need, our edifice of happiness—the work of many days, built up to shelter ourselves and others—may all fall down in one hour. There must be in our recipe, added to the ingredients already stated, a small quantity of self-control in temper. The habit of cheerfulness will in time create a good temper; and, strangely enough, an honest pretence to be cheerful produces cheerfulness perfectly genuine. Lastly, look to what we have, not to what we have not; and let not trifles vex and sadden us, since our heart is made for greater things.

This closes the popular recipe for keeping an even mind; but to be happy is something still beyond. Where, then, is the philosopher's stone, that turns common things to gold? Where is the mark we can always hit, if happiness be the sense of hitting the mark?

Any observant man or woman must have noticed that the pursuit of one's own pleasure makes one hunger more and more, and become less hardy, more dependent on circumstance. We must all have noticed, too, that in the worst dejection nothing roused soul and body so quickly as to do—not to say, but to do—something for another. Here, then, is the secret; here is the philosopher's stone that can fill the most unpromising path with gold. If we try to satisfy ourselves, we shall fail. If we seek our joy in others, we shall infallibly succeed; continually we can find something to do for their welfare or comfort, or pleasure or success—not in great things, perhaps, but in the details of every day. Herein is the straight road to being happy 'under all circumstances;' herein is hinted why Johnson's poor widow would not die. As a matter of fact, the secret works so well in many lives around us, that one might say, in a paradox, that active unselfishness seems like the last refinement of self-love. One might say so—in haste and ignorance; but one does not. For even if there be alloy in the gold, we are thankful to the weak and human hands that do their best to make and give it. For them, there is no earthly occupation so happy, and their happiness means health and energy, and the power of being generous at need.

MR ESHOLT'S YOUNG WIFE.

A STORY IN TWELVE CHAPTERS.

By T. W. SPEIGHT.

CHAPTER VIII.

WILMOT saw that he was on the wrong tack, so he determined to try another. He stood confronting Agnes, his face towards the entrance to the path, so that he could see any one the moment they turned the corner. 'No; it is not all that I have to say,' he went on with well-simulated passion and vehemence. 'When last I bade you farewell on that moonlight night which can never be forgotten by me, you told me that you loved me, and that you would be faithful to me, even though we might not be able to marry for years to come. I went, cherishing your image in my heart as that of my future wife. One or two letters I received from you; then came a long silence, which I was utterly at a loss to understand. When I returned to England, I found that your father was dead, and that you and your aunt had vanished no one knew whither. Everywhere I sought you, but in vain. Your concealment was very cleverly contrived, Mrs Esholt; I give you credit for that much. At last, by accident, our paths cross, and I find you—the wife of another! Now, I ask you, I demand of you, why you broke your faith with me? What had I done to be treated as you have treated me? Why

did you not write to me and tell me that you wished our engagement broken off, instead of leading me on in a fool's chase after a shadow? These are questions, Mrs Esholt, which I shall feel obliged by your answering.'

He acted the part of a wronged and indignant lover to perfection, and now stood with folded arms, his cheeks slightly flushed, in his dark flashing eyes an expression half made up of just resentment and half of the love he could not forget. He certainly looked very handsome: on that point every one would have been agreed.

The attack was so unexpected that Agnes knew not what to reply. Women are credulous where their affections are concerned; his impassioned manner and the earnestness of his voice wholly imposed upon her. He turned and went slowly along the walk; no one was yet in sight. Mechanically, Agnes followed him.

'I wrote you three letters,' she said in a voice half choked with emotion; 'and as soon as my aunt and I were settled in Liverpool, I at once sent you our new address.'

'I trust you will believe me,' he said impressively, but with a certain sadness in his voice, 'when I tell you that I never received any of the letters in question. But that perhaps was scarcely to be wondered at. We were trading up and down the coast, calling at various ports, but never stopping long at any of them. The other fellows on board were no more fortunate than I was as regards their letters from home.'

'They told Aunt Maria at the office that the letter she left there had been duly given into your hands, and if so'—

'Whoever told her so, lied!' broke in Wilmot vehemently. 'I give you my word of honour that no such letter ever reached me.'

'Even in that case, if you had written to Mr Ludford, he would at once have furnished you with our address.'

'Mr Ludford! I had almost forgotten the existence of such a person. I never saw him but once, and then only for half an hour. I knew no more where to find him than the man in the moon.'

There was not the slightest reason why Agnes should doubt the truth of what he had just told her. Never had she found him out in a lie or the semblance of one; why should she doubt him now? Her soul within her shivered as she listened to his words. Why, oh, why had she not waited a little longer? Why had her trust in him been so easily shattered? He had been true to her, while she!—

Suddenly Wilmot spoke again in low tones, which seemed to quiver with the passion he would fain hide, but could not. 'Agnes, I swear to you that at this moment I love you far more than ever I did, that you are infinitely dearer to me than on that night when we last parted! I know you are another's, that you can never be mine; but I must tell you this; I can keep silent no longer. I am willing to believe that circumstances were against us, that had you been less easily led, you would have remained true to me. But be that as it may, I have remained true to you—or rather, to the memory of that Agnes Granby whom I knew of old, for you are not her—you—are Mr Esholt's wife!' There was a

break in his voice as he spoke the last words; he turned away as if to hide his emotion.

It was a really clever bit of acting. In Mr Wilmot Burrell there was evidently the making of an accomplished *histrion*.

'O Wilmot, I cannot, I dare not listen to you,' cried the heart-stricken young wife. 'Let us return. Forget the past, and'—

'How easily come the words—"Forget the past!" We can no more forget it than we can alter it. But enough. You can never be mine; that I know to my sorrow. I ask but one thing—do not treat me so coldly, so like a stranger. Let me be at least your friend: more than that I dare not ask to be.'

They heard the others talking, and turned on the instant. Miss Esholt had purposely dawdled by the way, so as to give Agnes and Wilmot time for whatever they might have to say to each other. She glanced sharply at both of them as they came up. What she read in their faces was best known to herself.

'Davry,' she said that night to the faithful old servant, who was brushing her hair, 'Mrs Esholt is walking in a very pleasant meadow at present; but I see a precipice right in front of her.'

'Then, mistress, why don't you grab her by the sleeve and pull her back?' asked Davry the literal.

'She is walking towards it of her own accord and with wide-open eyes; why should mine be the hand to pluck her back?'

Wilmot's confession left Agnes powerless for some time to think of anything else. Could what he had told her be true? she asked herself again and again, while feeling it impossible to doubt that it was so. In that case, what a destiny had she woven for herself! In the belief that he was unfaithful to her, his image had been gradually becoming fainter and fainter in her memory, while her dawning love for her husband had been growing and expanding day by day. And now in a moment everything was changed. She acknowledged to herself, and trembled while she did so, that the ashes of her first love, which she had flattered herself were utterly extinguished in her heart, had been suddenly rekindled by Wilmot's passionate avowal that she was still as dear to him as ever she had been. Why had not Fate kept them asunder for ever!

After this, matters to all seeming went on as usual at The Hollies. Wilmot came and went as heretofore. All he had asked of Agnes was that in time to come she should treat him not as a stranger, but as a friend. How was it possible for her to refuse such a request? Little by little her demeanour towards him thawed, day by day her manner became less frigid and more familiar—but it was a familiarity that drew a line which was never overpassed by a hair-breadth. Agnes was still as careful as heretofore to give Wilmot no opportunity for venturing on any further confidences or confessions. It was a great strain on the young wife to have to keep on day after day playing the part she was now playing—to appear to the little world in which she lived and moved as nothing more than the quiet, equable friend of the man in whose heart, as she fully believed, the pulse of love still beat as passionately as of old, and still finding, alas! despite all her struggles to the contrary,

a faint responsive echo in her own. But the profound respect she felt for her husband, her admiration for his noble qualities, and the recollection of the vows she had taken upon herself at the altar—but more than all, and beyond all else, a certain something of which she herself was only half conscious, a something that touched the very well-springs of her being—upheld her and sustained her throughout her trial.

This change in the demeanour of Agnes was set down by Wilmot to a cause far different from the real one, as was nearly sure to be the case with a man of his calibre. He forgot, or did not choose to remember, that it was he himself who had implored her to treat him in future as a friend—as one who had been the companion of her youth, and had lived for months at a time under her father's roof. His vanity whispered that the love which he still fondly imagined she felt for him was gradually obtaining the mastery over her will. Never had he been more mistaken in his life. The false inference thus drawn served but to confirm and strengthen him in a certain dark design which had been simmering in his brain for some time. He was of a sanguine disposition, and he secretly exulted in the certainty of its accomplishment; but he was far too wary, or, as he would have termed it, too 'wide awake,' to betray anything of that which was passing in his mind. To all appearance he was just the same as on the day he first set foot across the threshold of The Hollies: to Mr Esholt, deferential, without the slightest trace of servility; to his wife, respectfully familiar, but still with a certain distance in his manner towards her, and not often addressing her individually; to Miss Esholt, amusing, chatty, and at all times evidently desirous of making himself as agreeable to her as possible.

But Miss Esholt flattered herself that she was not deceived by these outward manifestations either on one side or the other. She had half divined from the first that there had been a love episode between Agnes and Wilmot at some former period, and herein lay the secret of her tactics on the day of the excursion to Rushmere Grange. She had noticed from the first how studiously Agnes had avoided the possibility of any tête-à-tête with the young man; which only made her the more determined that the chance should be afforded him if she could anyway help in bringing it about. It had seemed to her scheming brain that such an interview might have results unforeseen and uncounted on. She was right in believing that Wilmot, all his studied indifference to the contrary, was still secretly in love with Agnes; but as regards the latter, she was, equally with Wilmot, in the wrong. Having no particulars of the interview between the two to guide her in arriving at a conclusion, she not unnaturally attached a wrong value to the change in Agnes's demeanour towards her former lover. 'Step by step she is drawing nearer the precipice,' she murmured to herself more than once. 'Can it be that she is walking blindfold, and does not see whither the path she is treading will lead her? No—I cannot, I will not believe it.'

Some two or three weeks passed thus, when one morning Mr Esholt received a letter which necessitated his immediate departure from home

on a business matter of much moment. He did not expect to be away longer than a week; but as the autumn was now well advanced, and as the fine weather seemed to have broken up, he suggested that during his absence the ladies should effect their removal back to Everton. Agnes scarcely knew whether to be glad or sorry that her sojourn at the seaside was thus brought to an abrupt conclusion. She dreaded going back to a renewal of her former experiences in the gloomy old house, and to the daily, almost hourly companionship of Miss Esholt. But on the other hand, was it not well for her that this brief spell of sunlight should come to an end as quickly as possible? Since the day at Rushmere, her thoughts had gradually become tinctured with a dangerous sweetness, to indulge in which, as in the case of certain insidious drugs, seemed to become more of a necessity day by day. Yes, all things considered, it was decidedly for the best that she should go back to Everton and that as speedily as possible.

One of Mr Esholt's last requests before leaving home was that, in his absence, Wilmot Burrell should act as escort to the ladies on the occasion of their journey from New Brighton to Everton.

The news of their departure fell on Wilmot like a thunderclap. He had of course known that the sojourn at New Brighton must come to an end before long; but he had quite counted on its lasting three weeks or a month longer. Mr Esholt's sudden determination seemed likely to interfere seriously with certain plans of his own. When once Agnes was back at Everton, she would be as good as lost to him. Mr Esholt might perchance ask him to dinner once or twice a month, but that was as much as he could look forward to. Whatever he might have to say to Agnes in private must be said before she left The Hollies.

Chance seemed to favour his designs. On the evening before the day fixed for their departure, he called upon the ladies to ascertain whether all their arrangements were completed, or whether they had any final instructions still to give him. He found both Miss Esholt and Miss Remington at The Hollies; but was told that Mrs Esholt had gone as far as the library to take some books back; so, as it was now growing dusk, and there were a number of noisy excursionists about, he said he would go part of the way and meet her. He encountered her about half way as she was coming back. She was somewhat surprised to see him, but made no comment. They walked for a little while in silence; then Wilmot said: "How soft and still the evening is! But for those noisy revellers in the distance, one might fancy all the world asleep. Somehow, an evening like this always carries me back in memory to those happy hours, "twixt the gloaming and the mirk," which now seem so long ago, when we used to pace the vicarage garden together, or wander drowsily, hand in hand, by the side of the soft-flowing river. Old memories and old faces will start up before the most worldly of us at times, and transport us by their magic spell to the happy past. Are you, Agnes, never haunted by such visions of the days that were?" He ventured a glance at her face as he asked the question, but in the dusk he could read nothing.

It was the first time he had ventured to call her by her baptismal name since that day at Rushmere. Some fine instinct seemed to put her on her guard in a moment. "We are all of us, I hope, haunted by visions of the past at times," she said gently, but a little coldly. "We should be worse than we are were it not so. But why dwell so much on the past, Mr Burrell? Why not labour in the present, and look forward to the future cheerfully and with a brave heart?"

Both her words and her manner stung him. "And what is the future to me?" he asked passionately, forgetting for the moment the *rôle* he had imposed upon himself. "What have I to hope or care for in time to come? Nothing. You have taken care of that. It is easy for you to preach of hope and cheerfulness—you who can look forward with complacency to always enjoying the same tame, pulseless existence that is yours to-day. But with me it is different. When once I love, I love for ever, and if I cannot possess that which I love, do not ask me to be happy. Why were you faithless to me? Why did you desert me for a richer man? You have taken from me what I valued most on earth; you have stabbed me to the heart, and now you mock me by asking me to sit down, destitute and bleeding, and delude myself with the idea that I am content!"

This was not at all what he had intended to say. He had intended to be sentimental and pathetic; to let her see that the smiling mask he wore before the world hid a bruised and bleeding heart; he had wanted, in short, to so far enlist her sympathies for his assumed sufferings that after her return to Everton his image should still be paramount in her thoughts. Unfortunately for his purpose, he had allowed his temper to carry him away, and almost before the words had passed his lips, he felt that they would have been better unsaid.

Agnes walked on for a few paces before she could steady her nerves sufficiently to reply. When she did speak, it was in cold, measured tones, in which there was an unmistakable touch of scorn. "Mr Burrell," she said, "you and I have always been good friends: we might, perhaps, have been more than that had circumstances controlled our lives differently; but more than friends we can never be now, and less than that there is no desire on my part that we should be. If, therefore, you have any wish that the friendship between us should remain unbroken, I say to you—Beware. It will depend on yourself in future whether we meet as friends or as strangers."

They reached the garden gate as she ceased speaking. She passed through, thinking that Wilmot would follow her; but he came instead to a sudden halt and let her go forward into the house alone. He felt that in his present mood he could not face those "two other women," as he termed Miss Esholt and Miss Remington to himself. He turned on his heel moodily and took the road which led back to his lodgings. He was savage with himself, savage with Agnes, and, as a matter of course, savage with creation in general. "I'll bend or break you yet, my fine lady, despite your virtuous airs, which are all a sham, and merely put on to hide your

cowardice,' he muttered between his teeth. 'You love me in your heart, and you can't help yourself; and you shall yet be mine in spite of everything!'

OUR OLDEST STAPLE INDUSTRY.

SALT MANUFACTURE.

UNTIL recently, it was the custom, at certain festive seasons, to admit the public to an illuminated rock-salt mine in Cheshire, generally for some charitable object. The sight was at once interesting and impressive. Those stupendous pillars holding up the crystal roof, from which depended great stalactitic masses, sparkling in the reflected light of myriads of candles, struck the beholder with amazement; and as he beheld, he could not fail to reflect with what a liberal hand Nature had provided for one of the sternest of human necessities.

Here, in the district of which Northwich is the centre, are situated those great beds of salt and reservoirs of brine which supply the wants not only of England herself, but also of a large part of the habitable globe. For salt is a necessity—a prime necessity—of human existence. Its very abundance and cheapness make us, the possessors of these rich stores, think perhaps all too lightly of it. Elsewhere, the case is different. In India, for example, where natural beds of salt are found only in limited areas, and those chiefly in the north, vast numbers of our fellow-subjects are dependent upon the supplies they get from England. The people of India are poor, and taxes upon food are to them, as to us, a grievous burden; yet this necessity of life is taxed, and—so statesmen tell us—necessarily taxed, for purposes of revenue. What would the Englishman say if every ounce of salt that comes to his breakfast-table had first to pass under the thumb of the exciseman?

An industry so important, and withal so ancient, carried on in our midst presents many features of interest. Its history is interesting; the methods of carrying on the industry are interesting; and above all, the effects of the industry upon the physical contour of the district are interesting, and it may be added, even alarming; for do we not read every now and then of subsidences of the ground—of mines falling in—of lakes forming upon land where not many years ago corn was reaped—of churches, bridges, and dwelling-houses having to be abandoned, and even of risk to human life from the sudden formation of deep holes in the middle of a populous district?

Let us examine the facts, and see how, from small beginnings, the Cheshire salt-field has obtained so important a place in the world's economy.

Salt was manufactured in the district in very ancient times. The produce, however, when the means of conveyance, and therefore of distribution, were limited was small, and the methods of manufacture of the rudest kind. But, whatever improvements may have been effected in manufacturing appliances, the method adopted was practically the same—that is, by the evaporation of the saturated solution of rock-salt, or brine. Natural brine-springs existed in the district, and were utilised, it would appear, before

rock-salt was even discovered. The Romans, it is believed, were not ignorant of them. In the earliest periods of which we have any record, the brine was raised from shallow pits by means of buckets and hand-pumps; at length, pumping-power was obtained by water-wheels and wind-mills; and finally, upon the invention of the steam-engine, this more powerful motor was brought into requisition. The place where salt was manufactured was anciently called a 'wich'; thus, we have still the appellations Northwich, Nantwich, Droitwich, &c., clinging to some of the chief centres of the salt industry.

Droitwich, which is situated in Worcestershire—and one of the most important seats of the salt industry outside the county of Cheshire—early sprang into importance. In the year 816, Kenulph, king of the Mercians, gave 'Hamilton and ten houses in Wich' with salt-furnaces to the church of Worcester; and about the year 906, Edwy, king of England, endowed the same church with Jepstone and five salt furnaces, or scales. Of the Cheshire wiches we find the first authentic record in Domesday Book. Inquiry was made, by direction of William the Conqueror, as to the holders of these places in the time of Edward the Confessor, the last hereditary Saxon king; and we have an account of the wiches and salt-houses then in operation. The rights of property were, even at that early period, exercised over the brine-springs and salt-works.

Some of the laws and customs which regulated the traffic in manufactured salt are exceedingly curious. Thus: 'Whoever loaded his wain so that the axle broke within a league of either wich, gave two shillings to the king's or the earl's officer if he were overtaken within the league. In like manner he who loaded his horse so as to break its back gave two shillings if overtaken within the league, but nothing if overtaken beyond it. Whoever made two horse-loads of salt out of one was fined forty shillings if the officer overtook him. If he was not found, nothing was to be exacted from any other. Men on foot from another hundred buying salt paid twopence for eight men's loads. Men of the same hundred paid one penny for the same number of loads.'

The salt manufacture in one form or another has been carried on in Cheshire from a very early period, the yield increasing with the population. After the lapse of many years, the pits from which brine had been drawn ceased to be remunerative, and were abandoned, others being sunk as occasion required. The area of manufacture has also extended considerably during the last century, and some places have sprung into importance, notably Winsford, in the valley of the Weaver, which at the present time disputes with Northwich the supremacy as being the chief centre of production.

The geological features of this remarkable salt-field are of peculiar interest. The formation of the 'meres,' so peculiar to Cheshire, is believed to have been due to the solution in past ages of beds of rock-salt lying at great depths below the surface. The depth of the water in one of these meres, at Rostherne, has never been accurately ascertained.

The area of the district in which the saliferous marls have been deposited is, according to Mr Dickinson, Her Majesty's Chief-inspector of Mines,

computed at seven or eight hundred square miles. These marls rest chiefly upon red and variegated sandstones, the exceptions being chiefly south of Macclesfield and beyond the east of Congleton to Odd Rode; and also in part of Lancashire, where they rest upon the carboniferous formation. Beyond Frodsham, extending in a westerly and then in a northerly direction, the salt deposits in the geological epochs seem to have been formed in what is now occupied by part of the estuary of the Mersey. In the salt districts of Cheshire, outcrops of the saliferous marls and marlstones exist in several localities, as at Acton and Winsford.

No outcrop of rock-salt now remains in the salt districts of the United Kingdom. The depth to the top of the rock-salt, called the rock-head, is one hundred and thirty-two feet at Northwich, and one hundred and ninety-five feet at Winsford, whilst at Middlewich no rock-salt has yet been discovered.

Geologists are by no means agreed as to the manner in which these enormous beds of rock-salt were formed. There is, however, a leaning by competent observers to the theory that during the Permian age successive subsidences and upheavals of the land took place; that at each depression of the surface the sea overflowed an extensive low-lying area, where eventually a deposit of salt was formed by evaporation; and that by repetitions of this process the vast beds which we now find were accumulated. In a rough way, the thickness of the beds has been averaged at one hundred and fifty feet, and the extent twenty miles by twelve or fifteen miles; but this extent has not been actually proved.

Practically, the deposits are considered inexhaustible. The upper surface of the rock-salt appears to undulate similarly to the undulations of the surface of the ground. It is upon the top bed of the rock-salt that the brine called rock-head brine ordinarily lies.

The raising of rock-salt is not now carried on to the same extent as formerly. Brine is abundant, and is more readily converted into the salt of commerce, the 'rock' produced by the mines being used almost exclusively in the alkali manufacture. The stores of brine will undoubtedly exist so long as there is plenty of rock-salt to which surface-water, percolating through the superincumbent earth and marl, can have access. The rock is very readily converted into brine by the simple process of solution, which is ceaselessly carried on under ground by the silent operations of Nature. As soon as it reaches a certain depth, the water finds its way into some one of the innumerable streams which are for ever eating away the rock-head, and flowing, in the form of brine, towards the works where pumping is carried on. These streams are locally called 'brine-runs.' This is a constant, ceaseless operation, in which Nature adapts herself in a wonderful way to man's necessities, till we have come to believe that what is will always be. So, indeed, we may take it, for all practical purposes; for, in spite of the increasing output of manufactured salt, no one has yet been known to express a fear, as in the case of our coal-supply, that we are within measurable distance of seeing the exhaustion of our stores.

The underground brine-runs have been proved

to extend for miles. The law by which they are guided seems only the requirement of a supply of water, and descent. Some of them, as the subsidences show, take nearly straight courses, whilst others twist about in various directions. The course taken will probably be where the resistance is least, or where the rock-salt is softest, or in hollows on its surface.

The quantity of brine used annually has been estimated at nine million tons, which will yield (allowance being made for waste) 1,800,000 tons of white salt. A gallon of fully saturated brine contains two pounds eight ounces, sometimes two pounds ten ounces, of salt. The general average of sea-water does not exceed three to three and a half per cent. The manufacture of white or table salt, and practically of commercial salt of every description, is effected by evaporation in shallow pans, either over a coal-fire or by the utilisation of waste steam from engine-boilers. The heat applied varies according to the quality of salt which it is desired to produce. Domestic salt of the finest grain requires for its manufacture a temperature of two hundred and twenty-six degrees Fahrenheit—the boiling-point for brine. As the liquid evaporates, the solid particles sink to the bottom of the pan, forming in the aggregate the lumps with which every housewife is so familiar. For commoner salt the temperature is one hundred and sixty to one hundred and seventy degrees Fahrenheit. This salt is close in texture, and clustered together in larger or smaller pyramids, according to the heat applied. For large-grained flaky salt the temperature is one hundred and thirty to one hundred and forty degrees Fahrenheit; and for large-grained fishing-salt, one hundred to one hundred and ten degrees—the slowness of the evaporation allowing the salt to form in cubical crystals.

What used to be called bay-salt, or salt formed by the operation of the air and heat of the sun, although still extensively practised in warmer climates, seems now to be a thing of the past in this country. In the earliest times, this process was probably the only one carried on. Either brine or sea-water was run into shallow pits or reservoirs, where it evaporated to a certain degree, the work being afterwards completed by pouring upon twigs, and sometimes, it is said, by pouring the liquid upon burning wood and collecting the salt deposited upon the ashes. Until long after historic times, wood was the only fuel used; it was not until the year 1656 that the substitution of coal, at Nantwich, is mentioned as a novelty. This might be explained by the difficulty of carriage in those days, as no coal-beds exist within a good many miles of the salt districts.

What, it is interesting to ask, must be the effect upon the district of the abstraction of this enormous quantity of rock-salt and brine? It is not difficult to see that some change in the physical features of the country must in process of time be brought about. And had past generations of those engaged in the manufacture given it a thought, they must have foreseen what is now actually taking place before our eyes. Not that they could have arrested the threatened mischief, for that was, and is, physically impossible, save by putting an end to the industry altogether. The inevitable, it may be said, is

now fully recognised by all interested—that, as brine is pumped up, every gallon representing so much of the 'rock-head' (rock-salt) washed away, so must the ground subside to fill up the subterranean caverns which are in perpetual course of formation.

The effects of this process of solution and pumping have become more and more visible in recent years, as the manufacture of salt has increased. Any one visiting the town of Northwich for the first time cannot fail to be struck with the singular aspect presented by whole streets of buildings. If an earthquake had visited the place, shops and dwelling-houses, bridges and public buildings, could not have presented a more higgledy-piggledy tumble-down appearance. Here we find an hotel yard where the earth not long since sank without warning, swallowing up a farmer's horse and leaving a yawning chasm dangerous to approach. There you see shops and houses which have sunk by a more gradual process, for the doorsteps are below the street-level, and the walls lean this way and that. The town bridge over the river Weaver some few years ago gave way, and became dangerous from the same cause. A building where sat the County Court judge has had to be abandoned; gas and water pipes are constantly breaking below the pavements; and, more alarming still, at intervals of a few years, subsidences on an enormous scale are reported, happily not in the town itself, but in the immediate district, threatening with swift destruction a considerable area. Yet the people take it all as a matter of course. Lakes of considerable extent have formed on what was, within living memory—within a score of years in some cases—rich agricultural land; and while the salt Companies are amassing wealth by this destruction of arable ground, it would appear that the luckless owners of the soil are without remedy! A sheet of water called Witton Flash, near Northwich, has been formed by the gradual sinking of the earth, beginning early in the century, until a year or two ago it was reported to be more than one hundred acres in extent, its depth varying from seven to eighty-five feet—the latter at a place where originally there was nothing but a small brook. In the process of subsidence, a corn-mill and other erections have been submerged. There are other 'flashes' or hollows filled with water in close proximity to that at Witton, and, like it, undergoing constant enlargement.

The most dangerous kind of subsidence is that which occurs—and happily the occurrence is rare—through the falling-in of a rock-salt mine. The last and most alarming occurrence of this sort was in 1880, when the roof of Platt's Hill Mine, belonging to Mr John Thompson, gave way, causing an inrush of water from the Weaver and from neighbouring streams, and filling up the mine to a great depth. This was not an abandoned mine, but was actually being worked. The inundation took place a little before six o'clock in the morning, ere the miners went down; otherwise, there might have been serious loss of life. Besides some old workings communicating with Platt's Hill Mine, that mine itself was very extensive, with excavations fifteen to eighteen feet in height, the depth of the shafts being three hundred and twenty-one feet. 'On my arrival,' says Mr Dickinson, the government inspector, 'next day I found the water up to seventy-eight feet from the top of the Platt's

Hill shafts, being considerably above the rock-head and nearly level with the Weaver navigation. Many acres of the surface were still on the move, with large cracks or breaks going on, and water was bubbling up in levelling itself in the numerous ponds, and, as air was being forced out under considerable pressure from the old excavations, bringing with it a smell, like sewage, or the long accumulated remains from powder-smoke. Parts of Ashton's salt-works and a large chimney had fallen into some of the chasms, and the road and the brine-pipes for conveying brine from brine-pits to salt-works were broken up.' The occurrence was considered one of the most extensive and alarming that had ever occurred in the district. When the inundation was in full force, the large ponds surrounding the old fallen-in pits looked like so many boiling caldrons with the water and air bursting up over the surface; and on the banks were a number of what were called by the people of the neighbourhood mud volcanoes, the wet earth being thrown up to the height of seven or eight feet.

The inundation of these old rock-salt mines is not wholly a disaster to their owners, for in course of time the water eats away the rock-salt until it becomes saturated, when it is pumped up in the form of brine. Such occurrences as that described are, however, sufficiently alarming. It is a fortunate circumstance that, up to the present time, there has been little if any personal injury either to workpeople concerned in the trade or to the general public on account of these repeated subsidences, though the damage to property is very considerable.

It may be remarked, in closing this paper, that a new direction has recently been given to the salt manufacture by the formation of what is known as the Salt Union (Limited). The object of the Union is 'to consolidate the undertakings of the salt proprietors in the United Kingdom, with a view to ending reckless competition,' which, it is averred, 'injuriously affects the salt industry without affording any adequate advantage to the public.'

MR MAGSDALE'S COURTSHIP.

IN FOUR CHAPTERS.

By EDWARD D. CUMING.

CHAPTER I.—HE PROPOSES.

MRS CORNELIA BUNSHAW sat in her armchair by the fire, dividing her attention about equally between the book on her lap and the clock on the mantel-piece. 'A quarter to twelve, and Peter is not in yet,' said Mrs Bunshaw; 'nearly midnight, and that precious pair still gadding about. It's disgraceful, scandalous! Once in a way, I shouldn't mind it, perhaps; but this makes the third late night in one week. I won't go to bed till I give Peter a bit of my mind, if I sit up till daylight to do it.'

This harangue, which was apparently addressed to the cat, referred to the lady's brother Mr Peter Magsdale, and her cousin Mr Allan Magsdale, who had gone out immediately after dinner 'for a stroll,' with a parting injunction to her not to sit up for them.

We will take advantage of the opportunity offered by Mrs Bunshaw's temporary quietude to describe her appearance and circumstances, the first being somewhat remarkable. She is a tall angular woman, of about fifty, with hard features, and large thick-lipped mouth. Gray hair, cut short, and rather unkempt. She wears a plain black stuff dress and an ancient shawl. She is a clever strong-minded woman, who has taken a prominent part in organising and promoting a 'Society for the Protection of Women's Rights,' the members of which still regard her as its moving spirit. She seldom takes an active part in its proceedings now, however, except at the annual meeting, when Mrs Cornelia Bunshaw's speech is looked forward to as the feature of an occasion whose importance is not yet fully recognised by the world on which the Society's operations are destined to have a stupendous and far-reaching effect. An unlovely being is Mrs Bunshaw, and we see her at her worst as she sits bolt upright, listening with wrathful eagerness for the footsteps she expects to hear every moment on the gravel path outside.

The late Mr Bunshaw departed this life many years ago, taking with him a wide theoretical knowledge of the rights of women, and a burning practical sense of the wrongs of man, for which he was indebted to the principles and teachings of the wife he left behind him. His childless relict now resided with her brother and cousin at Astley Villa, Putney. The former, Mr Peter Magsdale, was thirty-three years of age, a small retiring person, the very meekest and most timid of Somerset House clerks. His sister, who was left a considerable fortune, made him heir to her property on the condition that she was to take up her abode with him when and for so long as she pleased—a stipulation he often deeply regretted, but had not courage to repudiate. Mr Allan Magsdale, the cousin, aged twenty-six, was an architect by profession. He possessed a boundless fund of animal spirits, and his guiding principle in life was to obtain as much enjoyment from it as possible. It would be hard to find two men more dissimilar in every respect than Peter and Allan; but they lived together in the most perfect concord, until Mrs Bunshaw's arrival at Astley Villa wrought a change in the spirit of their dream, and drew them even more closely together than before.

'Peter would never behave like this if he were left to himself,' soliloquised his sister. 'It's Allan I have to thank for leading him astray. But it shan't go on. I'll let Peter understand that Master Allan must look out for other quarters. He shan't stay here another week.'

It would not be easy to define Mrs Bunshaw's objection to her brother's doings. They could not have caused her any inconvenience, and her task of sitting up for him was purely self-imposed. It is probable that the intense dislike she had for her cousin was the motive which prompted her to interfere, for she was perfectly correct in assigning

Peter's misconduct to him. Without him, Mr Magsdale would have known the orgies called smoking concerts only by name; the music halls of the metropolis would have been untrodden ground; whilst the idea of snug but rather uproarious little suppers after such entertainments would hardly have entered his mind. Now, thanks to Allan, he 'knew his way about;' and he reaped a fearful joy from his little wickednesses, which derived additional piquancy from the fact that the sister who ruled him knew little of the manner in which his evenings were spent. But though Mrs Bunshaw was ignorant of the exact nature of his nocturnal pastimes, and disdained to question him on the subject, the late hours he affected furnished her with ample grounds for the indignant wrath she cherished against the hardened sinner who led him astray. Latterly, she had observed a discreet reticence in her intercourse with Allan; his buoyant soul and unfailing good temper rendered him impervious to patronage and snubs alike; whilst his aggravating habit of turning her most cutting sarcasms into ridicule, had forced her to conclude that it was safest to leave him alone.

It was past midnight when Mrs Bunshaw's strained attention caught the sound of a latch-key being stealthily inserted in the lock, and she drew herself up to receive the delinquents, whose hushed movements in the hall betrayed their belief that the occupants of the house were in bed.

'We might have a little drink before turning in,' said Mr Magsdale as he opened the drawing-room door. 'Go and get the things from the sideboard, like a good fellow.'

Allan departed on his errand, leaving his unsuspecting relative to enter the drawing-room and encounter Mrs Bunshaw by himself.

'Are you aware of the hour, Peter?' she asked the startled man, with a tragic wave of the arm in the direction of the clock.

'About twelve, isn't it?' he replied with rather sickly nonchalance. He could never muster up courage to face his sister unless supported by Allan: she carried far too many guns for him.

'About twenty-five minutes past twelve, Peter,' said the lady in measured tones which conveyed a world of meaning.

Mr Magsdale drew out his watch, and after looking earnestly at it, acknowledged the impeachment.

'Ah, perhaps it is about bedtime,' he said, listening anxiously for Allan's approach.—'Missed the train—sorry we're so late,' he added in a penitent murmur.

Mrs Bunshaw turned upon him and with awful calmness began: 'I must leave your house, Peter. I came here with the wish and the intention of guarding your interests; but the life of debauchery which you lead—which you have been led into, I should say—makes my residence here impossible. I must go.'

She paused. Her brother would have given half his income for courage enough to bid her go and never return, but nature had not endowed him with it, so he sighed sadly and said: 'Oh no, Corny; I couldn't think of it.'

This, of course, was the answer she expected, and she resumed: 'I should be most unwilling to go—most unwilling; my duty is to remain

with you. But unless Allan Magsdale leaves the house, I must do so. You see that yourself.'

Mr Magsdale did not see it at all, but only replied again more faintly than before: 'Oh no, Corny; I couldn't think of it.'

At this juncture the door flew open in response to a vigorous kick without, and Allan entered with his tray. 'I can't lay hands on a bottle of soda-water,' he said testily. 'I suppose Cornelia?'

Mrs Bunshaw, who had escaped his observation in the dim lamplight, emitted a warning cough; and Allan altered his tone to one of persuasive sweetness as he addressed her: 'Have you any in the house, Cornelia?'

'None,' curtly responded the lady.

'Oh, never mind,' said he, taking her favourite armchair and stooping forward to turn up the lamp.—'Tell me when to stop, Peter,' he continued, pressing a glass into his kinsman's hand and grasping the decanter; whilst Mrs Bunshaw looked on in speechless rage.

There was not in all London and its suburbs a more temperate man than Peter Magsdale; but at this moment he was so absorbed in his sister's threatening attitude, which presaged an immediate storm, that he accepted half a tumbler of brandy before he noticed what had been given him. As he held it mechanically up to the light, Mrs Bunshaw strode forward and took it from his hand.

'Are you going to drink all this, Peter?' she asked, striving to speak calmly. She was furiously angry; but so well did she succeed in controlling herself, that the obliging Allan mistook her meaning, and courteously rose, offering to bring a tumbler for her. He had not the least intention of giving offence; it was not unusual for her to join them in a 'nightcap,' but he could not have selected a more unpropitious time to remind her of it. Mrs Bunshaw cast a withering look upon him, but did not deign to make any reply. She possessed herself of the decanter, carefully replaced the contents of her brother's glass in it, and, still retaining the decanter, swept from the room, leaving the two to enjoy what refreshment they might want from the water-jug. Having locked up the spirits, she returned, and, ignoring her cousin's presence, reiterated the announcement she had made before: 'Either I leave the house, or Mr Allan Magsdale goes; and I shall be glad if you will make up your mind on the point to-night, Peter.'

'She's in earnest,' said Peter sorrowfully to his cousin when the slam of Mrs Bunshaw's bedroom door pronounced her to be safely out of hearing. 'She attacked me about it as soon as I came in.'

'Pooh! she doesn't mean anything,' replied Allan easily. 'It will be all right to-morrow morning.'

'You don't know Cornelia,' said Peter; 'I do;' and he shook his head mournfully. 'Of course, it's out of the question for me to let her go away. She would alter her will the same day.'

'If you really think your sister wants me to leave, I'll go.—I know it isn't your doing, old fellow; and I should be glad to stay on myself, though the house hasn't been what it used to be for the last six months.'

Peter Magsdale's heart sank as Allan spoke;

he would lose much by his cousin's departure. Even without Mrs Bunshaw's restraining hand, he would never have the spirit to embark on a night's 'spree' all by himself; he would be completely lost without his guide. But that was a phase of the impending change in his household that he knew it was useless to dwell upon. If Allan went, he might say good-bye to his evening amusements, for Mrs Bunshaw would not allow him to go outside the garden after his dinner. He was a weak vacillating creature, and the influence his sister had over him was entirely due to her superior strength of will, though he always attributed his submission to the very remote 'prospects' contingent upon her demise.

'No more pleasure in life for me, if you go,' he said dismally.

'Oh, nonsense; you can take care of yourself by now.'

'Cornelia will make the house unbearable if I cross her,' sighed Peter; 'no more suppers at the Gaiety for me.'

'And what about Miss Cressburn, Peter?' asked Allan with a chuckle.

Mr Magsdale blushed, and assumed a more abject look of melancholy than he had worn before. Miss Mary Cressburn was a young lady whose acquaintance he had made through his cousin's kind offices, and to whom he had lately paid a marked degree of attention. She was an orphan, in poor circumstances, supporting herself and the aunt with whom she lived by giving music lessons. The Magsdales' visits to her house were always made in the evening, and Peter concealed none of his doings more jealously from his sister than this tender dalliance with his heart's mistress. Mrs Bunshaw had long cherished a matrimonial scheme of her own regarding him; and this gifted woman was so accustomed to regulate every action of his life without resistance, that she had brought herself to believe that the consummation of her wishes was only a question of time. The lady she had selected to be her sister-in-law was Miss Anna Terripeg, her most intimate friend and staunchest disciple. Miss Terripeg was by no means averse from the idea, and having satisfied herself on this point, Mrs Bunshaw had proceeded to sound Peter. It was mortifying to discover that the gentleman was not prepared to consider the subject of matrimony at all for the present, and persisted in treating her proposals with unbecoming lightness. This was baffling; but so long as his young affections remained free, there was room for hope: Miss Terripeg had at least no rivals to contend with, reflected Mrs Bunshaw.

Now, if she came to hear of his attachment to Miss Cressburn, she would spare no pains to sift the matter and throw obstacles in his way; indeed, if she took a firm stand, he doubted his ability to continue his courtship at all. A faint-hearted, timorous lover was our friend Peter. Miss Cressburn would have lent a willing ear, had he been able to screw up courage to propose to her; but he did not know this, and nursed his hopes fondly, confiding them to Allan, who, we must admit, had been mischievously diligent in furthering a business which he knew would be so distasteful to Mrs Bunshaw.

'You will be able to make opportunities of seeing her easily enough, if you care for her,' said

Allan, with an effort to prick a little life into his cousin. 'It's too ridiculous to let Cornelia have a word in that.'

'You don't know what she is,' groaned Peter. 'Cornelia and the Terripeg woman between them'— He broke off with a shudder, which moved Allan to uncontrollable laughter.

'I know quite enough, anyhow,' he rejoined. 'I'll look up some rooms I know of to-morrow, and I daresay I shall be able to move into them next week; so you may tell her that it's all settled.'

A very silent party assembled at breakfast the next morning. Mrs Bunshaw, not having been made aware of Allan's intentions, shrouded herself in dignified reserve. Peter was unusually gloomy and dejected; and his cousin having failed to draw him into conversation, devoted himself to his meal without even attempting to pay Cornelia the somewhat cramped civilities which duty demanded of him.

'I am sorry that it is necessary for you to leave us, Allan,' she said, in a tone which implied that it was all his doing, and much against her inclinations. She took his departure for granted, knowing she could have her own way about banishing him.

'I'm sorry, too; but I couldn't have stayed much longer in any case,' he replied; and he quitted the room, followed by Peter, who was carefully avoiding a tête-à-tête with his sister.

Allan's readiness to leave Astley Villa was a little disappointing to Mrs Bunshaw. She prided herself upon her adamant firmness, and had hoped her cousin would have given her a chance of displaying it by begging her to let him remain with them. She had prepared one of her 'little speeches' (Peter knew the kind), in which she would kindly but sternly resist such an appeal. It was annoying that this weak pretence of putting her authority on one side, this transparent assumption of willingness to go, should compel her to leave it unspoken. It was bravado, nothing else.

'I should have told Cornelia that I couldn't continue to live in the same house with her, if I had stayed in the room another five minutes,' said Allan as they started for the station *en route* for their respective offices.

'It's no use quarrelling with her,' said Peter.— 'By the way, will you come with me to Queen's Road on Sunday afternoon? I want to see Mary Cressburn.'

'I'll come; and I hope you will take advantage of the occasion, Peter. I suspect your evening visits are things of the past.'

As a matter of fact, Mr Magsdale had proposed the visit with the deliberate intention of 'coming to the point,' trying to close his eyes to possible results. 'I was just thinking about it,' he replied.

'That's right,' said his mentor encouragingly. 'I'll take care you get a chance; and see that you make the most of it.'

'I don't know what Cornelia will say,' the amorous Peter went on after a pause. 'Don't you think I had better tell her?' He looked up questioningly, and his adviser promptly gave him his directions.

'Now, look here, Peter,' he said. 'You just hold your tongue until you are safely married.

If Cornelia finds out before, I don't believe you've got the pluck to defy her; and as a row is inevitable in any case, you may as well let it stand over till it can do no harm.'

Mr Magsdale fairly gasped: this was taking time by the forelock with a vengeance, and the very idea of such a step took away his breath. He had the most implicit confidence in Allan, however, and was so accustomed to follow his guidance, that he did not even raise any objections; indeed, he hardly realised what the advice implied. 'Thank you,' said this trembling lover. 'It would be the best way, I believe.'

'Of course it's the best way. Why, my dear man, we'll have you nicely settled before Christmas!'

Within six weeks! Allan's audacity carried Peter away, and he parted with him, feeling, that if Miss Cressburn's answer should be 'Yes,' he was committed to a line of action she would not be likely to approve of. 'I'll wait and see,' he wisely decided. 'If she thinks Allan is right, we will follow his advice.' Nevertheless, he quailed as he thought of the consequences he would have to meet afterwards.

The important Sunday afternoon came round at last, and Peter set forth on his knightly quest, squired and stimulated by the indefatigable Allan. They had some difficulty in escaping without Mrs Bunshaw, for her brother's preoccupation had roused her suspicious nature, and if Allan had not stepped into the breach, the expedition must have been abandoned. They were only going to call on some friends of his up at Queen's Road. Of course, if Mrs Bunshaw cared to come, they would be delighted; but it was a long way, and the people were not very interesting. The explanation allayed her doubts, and she let them go, reflecting that they could not get into much mischief on Sunday wherever they went.

'Does Miss Cressburn know anything about Cornelia?' asked Allan as they walked along.

'No. Do you think I ought to mention her?'

'I wouldn't, unless you are prepared to bring them together, which would hardly suit your plans.'

'Not at all,' replied Peter briskly. He was beginning to feel quite reckless, now his mind had been made up for him, and was prepared to rush upon his fate as soon as he found himself face to face with it.

Allan certainly did everything the most sympathetic helper could be expected to do in such a case. He drew old Miss Parkins, the aunt, to one end of the room, and exerted himself manfully to keep her attention from the pair in the distant corner. He knew that if Peter imagined that he was being watched, he would be thrown completely off his balance for the time; and as Miss Parkins' ideas were few and her conversational powers somewhat undeveloped, his task was not an easy one. Moreover, she suspected the nature of Peter's mission, and did not altogether approve of it; and at the end of a quarter of an hour she broke away from Allan, and approaching her niece, asked her pointedly if she was not going out for a walk this afternoon. Miss Cressburn started; but after a tender inquiring glance at Peter, answered in the affirmative, and the two ladies left the room together.

'Congratulate me!' exclaimed Mr Magsdale with a comical assumption of superiority.

'With pleasure.—Did you find any difficulty?' asked his cousin with the air of a man who did that kind of thing every day of his life and was versed in its intricacies.

'None whatever,' replied Peter. 'But I must say I am glad it's over,' he modestly added.

'Ah! Have you settled the day?'

Mr Magsdale had not settled the day; he had found the task of declaring himself quite as much as he could manage, and was content to leave the rest in abeyance for the present.

Allan looked a little disappointed. He was bent on revenging himself on Mrs Bunshaw, and had cherished wild schemes of a civil marriage at the registrar's office in the course of the ensuing week. His notions on the subject were crude, to say the least of them, and he had lost sight of the fact that Miss Cressburn was not likely to prove so tractable as Peter.

Miss Parkins and her niece now returned to the room, and the four set out on their walk. It was a lovely afternoon: a stray September day seemed to remain behind to contrast itself with the murky November, which is the unpleasantest month of the London year, and Miss Parkins, who was an enthusiastic pedestrian, evidently intended to make the most of it. She took possession of Mr Magsdale, and, much to his chagrin, he had no opportunity of speaking to Miss Cressburn again by herself, though her aunt followed the young lady's movements with tantalising closeness.

Unfortunately, some malignant fate prompted Mrs Bunshaw to go for a solitary walk that afternoon, and so guided her steps that she came upon the little party at the moment Allan was bidding Mary Cressburn good-bye with more tenderness than Peter considered was at all necessary. She saw them without being observed herself, and passed on, resolving to take her brother to task as soon as he returned. 'These, then, were Mr Allan Magsdale's friends; these were the people Peter had been so anxious to go and see without her.' There was something at the bottom of this, and Mrs Bunshaw intended to find out what it was.

She was very stern and forbidding in her manner when the cousins came in; a tactical error on her part, for it caused Peter to avoid giving her the chance she wanted of cross-examining him by himself. She was anxious that Allan should not hear her inquiries, but finally curiosity overcame her, and, she spoke. 'Who were the ladies I saw you with to-day, Peter?' she asked carelessly.

The question was so utterly unlooked-for, and Peter's mind at the moment was so taken up in thinking about one of the ladies, that for an instant he fancied that his sister had acquired a new and dangerous talent for thought-reading.

'They were friends,' he blundered—'friends, friends of'—He broke down, and threw a beseeching look at Allan, who swallowed a morsel with provoking deliberation and came to his aid.

'Great friends of mine, Cornelia,' he said airily. 'Very dear friends. I took Peter to see her—that is, them, as I thought he'd like to know them.'

If Mrs Bunshaw's eyes had been turned upon her brother instead of the speaker, the look of intense relief and gratitude he cast at Allan might have turned her suspicions into the right channel; but as it was, she remarked that she had passed them, and wondered who they were.

'Who are these friends of Allan's?' asked Mrs Bunshaw, when that mendacious person left the room.

'A Miss Parkins and her niece,' said Peter, who had seized his cousin's hint, and meant to act upon it even at the sacrifice of truth.

'He seems to know them very well,' she continued, watching him narrowly.

'Yes, I believe he does,' assented Peter.

'The young lady is the attraction, no doubt.—Does he seem to like her?'

'Oh no—I mean yes,' replied the unhappy Peter, recovering himself in time. Allan like Mary! He recoiled from the idea, but must support it to save himself.

'He said the other day it would be impossible for him to remain here much longer in any case,' mused Mrs Bunshaw. 'I thought at the time it was merely brag; but now I begin to see daylight. Mr Allan no doubt is very clever and very deep; but he doesn't think to deceive me, I hope: I can put two and two together.'

So Cornelia Bunshaw put two and two together, and, like many people who are inexpert at such worldly arithmetic, she made them anything but four.

LUNCHEONS.

As some trades and callings have always been ridiculed or denounced, so some meals have been selected as butts for the attacks of moralists and sanitarians. 'Suppers' were the favourite *bêtes noires* of certain 'abstinence doctors' of the last century; and in one of the medieval 'Moralities,' the play turns upon a solemn trial of this meal before the judge 'Experience.' 'Supper' is accused of having murdered four persons by gorging, and only escapes the extreme penalty of the law by agreeing never again to approach within six hours of dinner. Elderly persons may remember a similar prejudice against the now universally acknowledged meal of luncheon. When four or five o'clock was the usual dinner hour, some sturdy individuals held it needless to partake of refreshments between breakfast and the later meal. To require such extra nourishment was akin to the enormities of desiring bedroom fires, warm water for ablutions, and other 'coddling' and effeminate luxuries. It must be confessed that, in houses where luncheon was provided, its opponents often ended their objections after the fashion of the gentleman described in one of Miss Sinclair's novels, who finished his denunciations against this repast 'in the way gentlemen usually do, by drawing his chair to the table and making a hearty meal.'

Luncheon has now triumphed over its opponents and become a recognised institution; unless we look upon it as an old friend rechristened, the dinner of ancient times being at the modern luncheon

hour; while our ancestors supped at the hour at which their descendants dine. According to Dr Wendell Holmes, luncheons are among the pleasantest forms of social hospitality. 'This luncheon is a very convenient affair; it does not require any special dress; it is informal; it is soon over; and can be light or heavy as one chooses.' Breakfasts, a form of entertainment so popular years back, and still patronised by some persons, are less admired by our American visitor.

Many and varied are the forms of luncheon entertainments. There is the social country-house gathering, with a view to an afternoon of lawn-tennis or archery, a meal to which no formal invitations are issued, but to which intimates drop in, or are brought at the last moment by members of the family. A hospitable household, well supplied with young people, usually makes luncheon an elastic meal as regards numbers. Dinner is a more formal affair, and sacred from sudden additions; but at luncheon, Mary's school-friends drop in unrebuked; and Charlie meets young Robinson riding past the gate, and makes him dismount and remain for lunch and a game of tennis after the meal; which has a pleasant informal sociability about it. Luncheons of this description are useful factors in the game of matrimony, intimacies being formed at these friendly entertainments which could never take place at a formal dinner-party. Then there is the more stately London luncheon-party, to which guests are bidden by formal invitation, but which has always the advantage of brevity as compared with the dinner-party. Shy celebrities who profess 'not to go into society' and to eschew 'late hours and formal parties,' can often be lured into attending a luncheon meal; and the hostess finds it possible to capture a lion at half-past one, whom she could never have secured at eight o'clock. Pleasant, too, are the luncheons in the open air, when the ladies of the country-house meet the hungry shooting-party, bearing with them a store of good things, which are enjoyed as meals under a roof, served in ordinary fashion, never can be. There is something absolutely appetite-provoking in the very description of that famous out-of-door luncheon in *Pickwick*, when Sam Weller arranges the viands with suggestive comments, and Mr Pickwick at last falls a victim to the insidious seductions of 'cold punch.' Picnic parties proper are less agreeable. An out-door luncheon should never be too large and pretentious an affair. A small party of intimates and a simple repast are infinitely more pleasant than an assemblage of persons half strangers to each other, and an elaborate menu that requires the attendance of servants. Picnic parties of this latter description are usually very dull affairs. As Albert Smith records:

The wood was always very damp,
The water never boiled;
We wore the smartest things we had,
And they were always spoiled.

How many of us have pleasant recollections of luncheons eaten at the side of a hill in company with a Highland guide; of simple repasts at wayside rural inns during a walking tour; of well-earned refreshment during a tough Alpine

climb. More enjoyable are the sandwiches and flask of sherry than the elaborate repast of the fashionable picnic party, happily now a rare form of entertainment. Years ago, picnics were often organised; and middle-aged people sat on shawls on the grass with secret fears as to rheumatism, and tried to look as if they enjoyed eating with their plates on their knees; while the younger members of the party, in their best apparel, flirted discreetly, but would have been happier if their dresses and complexions had been less exposed to sun and possible showers. Ours is scarcely the climate for fashionable folk to play at Corydon and Phyllis in the open air.

Of all luncheons, the 'family one' is perhaps the most objectionable, at least to others than members of the family. Many mothers practise the highly commendable custom of gathering their olive branches about them at the mid-day meal, when, to quote an educational guide, 'the parent can judge of her children's health by their appetite, and correct any little breaches of good manners at table.' All this is praiseworthy and excellent; but it is a mistake to invite guests to the scene of these maternal cares. The visitor at one of these juvenile assemblages need not expect to gain any attention from his hostess. Vainly does he relate his choicest anecdotes and essay his best conversational powers. Willie invariably chokes himself at the critical part of the story, or Mary requires a second helping just as the guest has fairly started an interesting topic of conversation. The mother's attention is always wandering and divided. The children, their needs, their accidents with table utensils, their solecisms of etiquette, engross her real interest, though she makes a hollow show of listening to her visitor. Probably, if a woman, the guest is expected to perform small table offices for the little ones—to cut up meat, crumble bread, and the like—tasks which, if unaccustomed to the charge of children, the visitor performs amiss, and is rebuked for her shortcomings by the juveniles. 'O ma, Miss — has put gravy over my bread;' or, 'I can't eat fat, you know.' Children are delightful in their right place; but are not good assistants of digestion to persons unaccustomed to their society. It would be kinder, to both children and visitors, if parents who preside at 'family luncheons' were to invite their guests to other repasts than these meals.

The luncheon in its pleasantest form is only an enjoyment possible to the rich—at least of the male sex. Busy men cannot afford the time to indulge in this luxury. A biscuit or a sandwich hastily devoured constitutes too often the mid-day meal of many a professional or business man, and hence, say the doctors, come manifold forms of dyspepsia. Yet what is the worker to do? To leave chambers or office and partake of a solid mid-day meal, returning at once to brain and desk work, is to treat the digestive organs in the worst manner. To sacrifice a couple of the busiest hours of the day is equally out of the question. Professional men are rarely absolute masters of their own time, and cannot break up important consultations, dismiss clients or patients, delay answering letters, refuse interviews, because it is their luncheon-time.

The labourer or the artisan is sure of his uninterrupted mid-day meal-hour; the better-class

toiler has no such privilege. Hence luncheon has, for many of us, when we are able to partake of it in due and leisurely form, all the pleasure of a rare luxury.

ODD THINGS FROM CHILDREN.

AN examiner in elementary schools often hears many amusing answers in reply to his questions. The following are examples of written composition from children in the upper standards. It must not be assumed, however, that in giving these quaint specimens, any slur is being cast upon the general character of the work in elementary schools; these are taken from many thousands of papers, a great number of which are of undoubted excellence, and it often happens that where the majority of the pupils in a class acquit themselves satisfactorily, one child will be found who is quite 'at sea.'

Here is a description of a plum-pudding by a boy whose knowledge is evidently theoretical, and, like his pudding, somewhat mixed: 'When they have put all these in, they make it into a batter and then mix it up: and when they have finished battering it, they put it on the fire for about an hour and a half, to get it to be enough, so that it will be better to eat and softer to chew.'

From cooking we come to natural history, and have the following: 'Guinea-pigs are very pretty little creatures, and people generally have them as a joint for dinner.' The guinea-pig and the sucking-pig were evidently one and the same in the mind of this ingenuous youth.

Here is another in the same department of learning: 'Bees live chiefly on worms and snakes, and are searching for them nearly every hour of the day. Besides this they also live on little insects, which when they are not so very busy, they go down into the ground and have a very nice feast. It is very pleasant indeed in the summer time to watch them making their hive and weaving their honey.'

A pupil was asked to name and describe four kinds of fruit, with this result: 'The four kinds is apples, pears, rubub and carrots and many others.' He was a town boy, whose garden of nature was evidently a greengrocer's cart.

Here is some light on another branch of knowledge: 'Whale ships are large, and have an hold in which a lubber is stored.' Seamen will agree that the hold is the best place for the lubber.

The following on 'feathers' was very difficult to interpret, but at last it proved that the writer had mistaken features for feathers. 'The feathers of anything is the looking of you: some people have deseases and cause them to have an unpleasant look. Sometimes when people go to apply for a situation they don't get it owing to their feathers and bad faces; the master who they ask generally says that he takes beer and won't do for a job of that kind. People who is not ill so much generally has good feathers, they are obtained from keeping yourself clean.'

Dr Charles Wilson, in his general Report on the Scottish Training Colleges, gives several curious answers which have been received from candidates and pupil-teachers. A young lady answering a question on insurance, wrote: 'The money is provided by the Company to defray the expenses of the birth of members in pecuniary distress.' A second demoiselle in commenting upon the proverb, 'Penny wise and pound foolish,' wrote in a mathematical sort of way, and it is feared with some degree of misanthropy: 'This proverb clearly shows that for every wise and good action a man does, he will commit two hundred and forty foolish bad ones.'

One pupil brought Julius Caesar before the public in the light of a wonderful inventor: 'Julius Caesar invented Great Britain, 55 B.C.'—by writing that, a suspicion exists that copying is still in vogue. What a disaster a single mistaken letter deservedly occasions to the young plagiarist! 'Ethelred the Unready was called that because he was never ready for the Danes. He use to entice them away from England by brideing them, but they use to come again and demand a larger bride.'

Poor William Rufus's end was sadder than we wist, if we are to believe a youth, who says that William Rufus was gorged to death by a stag in the forest his father had made to hunt the deer.' Another writes: 'Prince William was drowned in a butt of Malmsey wine: he never laughed again.'—A small biographer of the Maid of Orleans writes: 'Joan of Arc was the daughter of a rustic French pheasant which lived in the forest. . . . She did not like to leave her pheasant home, but after a while she went away.'—'In the rainy season,' says a little pedant, 'the barren desert becomes animated with torrents of luxuriant vegetation.' Before leaving the humours of boys, an oral question and answer may be given. 'What do you mean by a temperate region?' asked an inspector, with a due emphasis on the word temperate. A little boy replied: 'The region where they drinks only temperants drinks, sir.'

Physical science is a dreadful stumbling-block to most youths. Asked to give the causes of sound, a sufferer wrote: 'Sound is caused by the motions of the air, and is carried about by the German band.' A curious dogmatiser, in 'explaining' the origin of a draught, says: 'A draught would be felt near the broken window of a warm room, because if you stood near it, you would feel it.'—A boy, who appeared to believe friction as something tangible, perhaps a sort of newfangled firelighter, scribbled: 'Friction is caused by the rubbing together of two sticks; it is very useful if you have not any matches.'—'What is a member?' asked an official.—'A man on the School Board,' was the answer.—A surname was thought to mean 'the name of a person you says sir to.'

In giving the names of the ten plagues, a respondent unduly enlarged the fourth, 'Plague of flies, beetles, and moskeeters;' whilst the murrain among beasts was written by another, 'Miriam among beasts.'

The following two were lately recorded in the *Schoolmaster*. A class had been asked to use the word dozen in a sentence of their own construction. One of the answers ran: 'I dozen

know what to do.'—'Stability' was ingeniously defined, perhaps by an unstable memory, as being 'the cleaning-up of a stable.'

As the science subjects of Physiology and Hygiene are making rapid strides in the elementary schools of this country, the following answers will illustrate to some extent the cramming system prevalent in these subjects. Here is what a young physiologist says: 'The food is nourished in the stomach. If you were to eat anything hard, you would not be able to digest it, and in consequence you would have what is called indigestion. Food is digested by the lungs; digestion is brought on by the lungs having something the matter with them. The food then passes through your windpipe to the pores, and then passes off your body by evaporation, through a lot of holes in your skin, called capillaries. The gall bladder throws off juice from the food, which passes through it. We call the kidneys the bread-basket, because it is where all the bread goes to. They lay up concealed by the heart.'

In reply to a question, 'Why do we cook our food?' one child replied: 'There are five ways of cooking potatoes. We should die if we eat our food raw.' A second pupil wrote: 'Food digested is when we put it into our mouths, our teeth chews it, and our mouth drops it down into our body. We should not eat so much bone making food as flesh making and warmth giving foods, for, if we did, we should have too many bones, and that would make us look funny.'

Dealing with ventilation, one student informs us that 'the thermometer is an instrument used to let out the heat when it is going to be cold.' Another writes, that a room should be kept at ninety in the winter by the fire, and in summer by a thermometer. A girl remarks: 'When roasting a piece of meat, put it in front of a brisk fire, so as to congratulate it.' Here is a very learned reply: 'Sugar is an amyloid; if you was to eat much sugar and nothing else, you would not live, because sugar has not got no carbon, hydrogen, nitrogen, and oxygen. Potatoes is another amyloids.'

In answer to the question, 'Mention any occupations that are injurious to health?' one reply was: 'Occupations which are injurious to health are carbonic acid gas, which is impure blood.' Another says: 'A stone-mason's work is injurious, because when he is chipping, he breathes in all the little chips, and they are taken into the lungs.' A third says: 'A bootmaker's trade is very injurious, because they press the boots against the thorax, and therefore it presses the thorax in, and it touches the heart, and if they do not die, they are cripples for life.'

In reply to a question on digestion, one child wrote: 'The food is swallowed by the windpipe, and the chyle passes up the middle of the backbone, and reaches the heart, when it meets with oxygen and is purified.' Another wrote: 'We should never eat fat, because the food does not digest.' A third says: 'The work of the heart is to repair the different organs, in about half a minute.' A fourth child says: 'We have an upper and a lower skin; the lower skin moves at its will; and the upper skin moves when we do.' A Fifth Standard child says: 'The heart is a comical shaped bag.' Another in that class writes:

'The upper skin is called epperderby, and the lower is called derby.' While a third, giving the organs of digestion, writes, stomach, utensils [intestines], liver, and spleen.

PROOFS OF AGE.

SINCE the abolition of feudalism, the sovereign of England has had but little concern in ascertaining the age of any subject; but previously it was otherwise. Whilst feudalism held sway in this country, and the landed possessions of tenants holding of the Crown in chief were, during the minority of the holders, in the hands of the Crown, the sovereign had a direct interest in testing the accuracy of statements made by heirs as to their age when suing for 'livery' of their lands; hence the existence amongst the Public Records of the documents known as 'Proofs of Age.' The witnesses examined at the taking of these *probationes* always gave the reasons for their knowledge that the particular heir of whom they were speaking was born in a certain year, and, consequently, then of full age. It is from these reasons that we are enabled to cull material which renders this series of records of historic and social interest.

Let us take first a few of the 'proofs'—we must of course deal with a subject like this in the most cursory way—which record historic facts. In that taken as to the age of Gilbert, son and heir of Thomas de Clare, in 1302, one of the witnesses remembered the date of the heir's birth by the fact that on Monday after the feast of All-Saints, twenty-two years before—that is, in 1280—he (the witness) was at 'a certain conflict' between the English and Irish at Kildroyn, at which Robert le Butiller received a fatal wound; and that Gilbert was born on the morrow of the feast of the Purification following the battle. Again, in the inquiry, taken July 15, 1303, as to the age of Richard le Heriz, one witness states that the heir was born exactly twenty-one years previously (1282 A.D.); and in that year, 'after the feast of St Martin,' Llewellyn, Prince of Wales, 'was taken and slain.' At the inquiry as to the age of John, son and heir of Roger de Tychbourne, taken in 1358, various witnesses agree that he was born at Tychbourne on the vigil of the feast of the Conception of the Blessed Virgin, in the eleventh year of the reign of the then king; and they knew this because on the feast of Saint Faith next following (1359 A.D.), the town of Southampton was burned by the king's enemies. In the year 1282, a witness, after stating that an heir had attained his majority, tells us that in the year before the heir's birth—namely, in 1260—there was 'a great scarcity of corn' throughout the country. These are a few of the very many really useful historic facts that are furnished by the Proofs of Age.

The incidents of social life illustrated by these inquiries are also curious. We learn from them

that, in early times, baptism was generally administered on the day of birth, or within two or three days afterwards. Towards the close of Edward I.'s reign, Richard, son and heir of Hugh le Heriz, of whom we have before spoken, was born on the feast of Holy Trinity, and baptised on the morrow of that feast; and in the year 1358, John, son and heir of Roger de Tychbourne—who, as we have seen, was born at Tychbourne—was baptised the same day at the church of that village. As years rolled on, the period between birth and baptism became gradually lengthened, till, in post-reformation times, we find quite a long period intervening. Still—even in Charles I.'s reign—the time was not so long as that often allowed to elapse in the present day. In a 'proof' taken in the year 1633, the jury found that the heir in question, Francis Petre, was born at 'Mauborough,' in the county of Wilts, on the 12th of December 1611, and baptised in the church of that town on the 23d of the same month. The particulars relating to the birth of the heir of whom a witness is speaking are sometimes given in the most minute detail. In the case of the Proof of Age of Francis de Skotland, an old witness, when questioned as to 'the place and day of birth of the said Francis,' answered that 'he was born at Worle, in the house of his father, on All-Saints' Day, twenty-one years ago, after dinner.'

The institution of parish registers in the reign of Henry VIII. ought to have prevented the necessity of taking verbal, and often, to modern ideas, very uncertain evidence as to the date of a birth; yet there is hardly an instance during the reigns of Elizabeth, James I., or Charles I. in which one of the authorised registers is mentioned as having been produced at the taking of a *probatio ætatis*; though entries of a birth made in the most irregular places—in any book, or on any scrap of paper that happened to be at hand—were frequently put forward. One instance of this must suffice. Towards the close of Elizabeth's reign, a jury was convinced of the date of an heir's birth 'by a writing in a certain book' in the hand of his father in these words: Thomas Syngleton was, by 'Gode's helpe, boren the sixth daie of Marche 1568, beinge Sondaie, at the latter ende of eleven of the clocke at nighte.' In early times we often find a very quaint place selected for entering the record of a birth. As a rule, the Bible or Missal of the parish church was selected; but in the case of Peter, son and heir of John de Fortesbury, taken in 1309, an aged witness stated he remembered that the heir was twenty-two on the Feast of St Laurence then last past, because that day, twenty-two years before, was the eve of his (witness's) mother's second 'marriage; on which day John de Fortesbury came to him, and besought him to put on record the day and year of the nativity of the same heir; and he immediately did so on the wall of his hall; and by this he knows the exact time.'

At the conclusion of one of these inquiries, the heir, when proved of full age, was sometimes provided with a wife. In the year 1299, in the case of a promising young Nottinghamshire squire, Thomas de Longvilliers, who had proved his age, one of the witnesses, 'questioned if the said heir is married, or not,' said: 'He is not.' The

King's Treasurer thereupon informed him 'that the lord the king offers him in marriage one of the daughters of Adam de Cretingges, deceased. And the same heir, having seen the daughters aforesaid, consents to marry the eldest of them. And because the same Thomas had sufficiently proved his age both by evidence of witnesses and by his personal appearance, and as he also assents to the marriage aforesaid, he has seizen of the lands of his inheritance.'

Proofs of Age exist from the time of Henry III. down to the middle of Charles I.'s reign; and from almost any one we take up, a good deal that is of interest might be noted. But we must bring these jottings to a close with the following reference to what took place in a country parish church in England at the close of the thirteenth century, the church in question being that of Ayston, in Hertfordshire. Here, on the feast of St Nicholas, 1293, the heiress of a neighbouring squire, Brian de Brampton, was baptised. One witness saw her being baptised at the church door, whilst his own marriage was being celebrated at the altar; whilst another states that he 'buried his mother' on the same day in the churchyard of Ayston Church, and on returning from the funeral, he met the child's godmother carrying her to baptism.

GOOD-BYE.

Soft falls the moonlight's silvery rays,
Glistening the crest of the wavelets dancing;
Fair is the maid, by the shore, who strays,
Gladness and hope from her blue eyes glancing.
Now, she is nearing the trysting-tree,
Soon her true lover she's fondly greeting.
Little she thinks, as the moments flee,
This is to be their farewell meeting.
Sad would the heart be, oh, bitter the sigh,
Could we know when we're bidding a last good-bye.

No longer the moonbeams gild the tide;
Athwart the sky is the lightning glancing;
The youth has sailed from his promised bride;
Safe in her home she is sweetly dreaming.
No dread forebodings disturb her sleep;
Peaceful, she rests on her snowy pillow;
Her love the while, where the surges sweep,
Lies cold and still 'neath the foaming billow.
Sad would the heart be, oh, bitter the sigh,
Could we know when we're bidding a last good-bye.

All through our lives we are dropping friends,
Bidding good-bye without thought of grieving,
And dark the shadow each parting lends
To the web of life we are deftly weaving.
In that land of light where no shadows rest,
Life's web complete, and our labours ended,
We shall find our lives had not been blest
Had the shadow ne'er with the sunshine blended.
Ah, grieve not, dear friend, heave no bitter sigh;
To the faithful and true there is no good-bye.

PRICE 1½d.

A WINTER DAY.

I HAVE a fireside-loving friend whom I invited to-day to come with me 'a mile and a bittock' along the sparkling hoar-frosted road, to see if the waterfall which leaps Croupie Craig had yet been chained in its wintry bondage of icy fetters.

'Ah no!' cried my friend with a shiver. 'The fireside is doubly cosy when the north wind whistles down the chimney. I will not go.'

'But think of what you will miss!' I persisted, proceeding there and then to depict my anticipated pleasure. 'And as for the north wind—his trenchant blast is a clarion call for us to join him out of doors.'

Would you credit it? My friend, who during the languid summer months takes a walk as regularly as she takes her quinine and iron tonic—and for the same purpose, I suspect—emphatically applied the poker to the very heart of the sparkling fire, and turning her back upon me, commenced significantly to needle her way among the impossible roses of her crewel-work. She evidently thought that I, too, ought to have something of that kind on hand.

But I made yet another attack. 'The long evening is before you; then you can bask to your heart's content in the blazing warmth of the fire and get your face roasted, while your back shivers under the insidious advances of John Frost. A jovial fellow is he, by the way, and he needs no artificial fire to keep him warm, for he can blow hot and cold with the same mouth, as you shall find if you walk with me.—What! You will not? You think it is going to snow?—Well, well; yours is the loss; and after all, no company is better than an unwilling walking-companion. So John Frost and I will e'en trudge it right merrily together, and leave you to drowse over your fadeless worsted roses.'

So I set off along the resounding frosty highway, which seems to have a natural affinity to my tingling feet to-day, with a delightful sense of enjoyment. My whole nature grows elastic under the stimulus of this pungent wintry air; and

every gust of the fitful wind sends pulsating, telegraphic messages of pleasantly import through my veins. I find myself actually humming an air straight in the teeth of a few vagrant flakes of snow which fall tardily from the gathering gray clouds, as if loth to lose their fleetly power of motion. How fleetly I am drawn onward by the electric impulse of the frosty wind! I seem to have winged feet, like the light-heeled—not to say light-fingered—god Mercury.

Although it is only half-past two in the afternoon, the sun has nearly finished his shortened circuit; already he has left the high fields of frosty azure, and struggles—a luminous yellow globe—amid the fast rising snow-clouds whose loose gray volumes are piled against the ominous western horizon. A social band of those cheery little outlaws, the sparrows, alight on the hedge all coralled with feathery hoar-frost, and hold an animated consultation, doubtless anent their next foraging raid; but as my footsteps strike an alarm upon the clanging ground, off they fly with a simultaneous whirl and chatter. May your shadows never grow less, O little feathered mendicants! You are not afraid to brave the wintry weather; and after all, there is nothing like hardship for testing the grit and sharpening the wits both of men and of sparrows. And see! here is kind Robin-Redbreast seconding my sentiments with all his might, displaying his cosy scarlet vest with quite unusual ostentation, as if to show that it is but the emblem of the fire of courage and 'desperate hope' that burns within his little breast. The hardy little fellow actually prefers bare boughs! He does not care a haw for scanty fare, but waits patiently for the thaw to bring the worms, which in the meantime are enjoying a frost-bound paradise of safety under the ground.

Rugged old Winter! How strong and austere he is; and so intolerant of weakness that only the hardiest of Nature's woodland folk can venture to face him. He sends the dainty and fastidious crowds that wait upon the Summer down below the ground, and into ignominious nooks

and crannies, and on wings of migration far over the sea. And yet I like the merciless old fellow. His head is so clear and his heart is so warm beneath its snows, that but to be an hour in his company on this sparkling highway is a rare delight. How fast one can walk when Winter is the guide! I have already reached the rude wayside smithy where a degenerate Vulcan is wielding his hammer with arms which doubtless were mighty and full of sinewy strength some generations ago; however, they are strong enough still to cause a merry din of crisply-reverberating echoes to challenge him from the whinstone quarry close by.

At last I reach Heather Lodge and struggle through the narrow aperture, which is all of its usually hospitable quadrant that the little gate has managed to wrench from the frost-distended earth. I wind my downward way between stiff bare trees and silvery-frosted evergreens until I cross the bridge which spans the stream as it leaps Croupie Craig; and making an abrupt descent, I find myself standing, lost in silent admiration, on the path below the waterfall. For King Winter reigns here supreme! He has captured the waters as they leap the Craig, and turned the glancing, rushing torrent into the pinnacles and minarets and sculptured grottoes of a fairy city. The rocks and ivy-wreaths and pendent tongues of fern are fantastically draped in the silver filigree of the frost. The very mist of filmy spray has been arrested and woven into a curtain of ethereal, cobweb ice before the Frost King's palace—a wonderful cold palace of sparkling ice, all dimly gleaming with a weird green light. What artist can match Winter? He needs no colours, no canvas, no paraphernalia of artist-craft. He breathes upon the scarcely visible spray of this waterfall, and behold, a forest of elfin firs and waving ferns, a world of fanciful imagery is traced upon the brown shoulders of the Craig!

'Find out my method, if you can!' he laughs. 'O puny artist-man—to your brushes, your marble, your clay, and try to imitate me! Those delicate branches of frosted shrubs, those deftly pointed leaves and fairy forests of pine, were fashioned by the identical hand and perchance by the same throe of creative power that filled your green forests with stately trees and branching ferns.' And certainly it is easy to fancy that these frost trees and flowers are the original designs from which leafy Nature works.

While I stand gazing at the frozen wonderland I feel how insignificant man is beside mighty Nature. She can do without man, for she has myriad silvan nations of her own to govern. And yet I am not sure after all if Nature is so entirely independent of man. Does she not ask dumbly yet eloquently for an interpreter? And who is so able to interpret her as man? She is cold, passive, material until he comes and attracts her by his magnetic humanity. Then is she drawn close to him; she responds to his inquisitive questionings like one of her own wild winds to an Æolian harp. She tells him her secrets,

unveiling to his awe-struck gaze her unerring, far-reaching laws; and she laps his senses in the subtle melodies of 'the music of the spheres.' Where is the limit to man's achievements if he goes through the ages hand in hand with Nature and learns from her?

Only a faint tinkle of falling water breaks the enchanted silence around me, for the frost has almost succeeded in capturing the usually thundering voice of the waterfall. But the captive water has discovered a weak link in the icy shackles, and sends one long zigzag lance of liquid music to tinkle among the icicles which fringe the rocky bed of the stream. At last I break the spell which has hitherto bound my feet, and turning from Croupie Craig, I pursue the serpentine curves of the rocky path, treading with every step upon the sparkling hoar-frost lying everywhere. Down in the green hollow winds and glitters the silent streamlet; for its babbling song has also been captured by the frost, although doubtless it croons to itself below the ice that shines like coiling steel as it gleams in and out past the precipitous crag of the Lover's Leap. My eyes are dazzled by the scintillating icicles that dangle over the ledges of the rocks, and by the pure hoar-frost which crests every adventurous ivy-wreath and tottering bush of broom as they peer over the edge of the crag.

Now I reach the wide-spreading waters of the Lower Fall, gloomily submitting to the frost-fetters which have reached it through all the barriers raised by overarching trees. It still retains a fragment of song—a doleful fragment it sounds in my ears, which are filled with the bewitching music of memory; for to-day the song of the waterfall is like a lament over the ruined harbour by its side. This rustic harbour has sheltered many a pair of happy lovers, many a thought-inspired youth, many a dreaming maiden—ardent young hearts who sought this water-haunted solitude in days gone by.

Still onward I walk, passing the wishing-well whose sacred spring is guarded by a group of young mountain-ash trees from every evil spell. Still onward, past piled-up trunks of felled oaks and sycamores lying upon the frozen ground, each prostrate giant marked and numbered for the sale. Here the streamlet, which bears a merry heart even in the midst of winter, escapes from the ice, and breaks the frosty silence with a triumphant rush of tripping song as it flows on its way to the lake. I startle a hungry thrush from an anxious quest among the stiff mosses under the beeches. He was evidently peering about to see if an accommodating and weather-wise mole might have been prophesying a thaw in the practical form of a soft red mound of worm-filled earth; but the thrush will look in vain, for the moles are snugly enjoying their leisure in labyrinthine homes far underground.—Ah, here is a poor little sparrow which has succumbed to the bitter weather! He is lying on his back quite dead and half-frozen to the grass. How pathetically his tiny stiff claws—once so busy, now so very still—are lifted towards the iron sky. No more will he bask in sunny holes among the summer dust. I have reached the pool at the source of the lake where the frozen-out waterfowl have sought shelter. In the summer-time this pool is lush with aquatic grasses

and extravagantly yellow with kingcups; but it is a tangled wilderness of sere grasses and broken ice to-day.

At last, here is the northern shore of the lake, and I venture upon its frozen surface to see how the landscape looks from that unfamiliar point of view. I am quite surprised to find how broad and strange the lake looks, and how suddenly dwarfed and small I feel. That, however, is doubtless a salutary experience which it might be beneficial to repeat sometimes. But suddenly I rush, startled, off the floor of ice in a great hurry, for my ears are assailed by the titanic growling of the lake as the water below its frozen crust struggles with the grappling frost. An eerie sound! I shiver, not with cold but with fear, as it dies, moaning, away.

I feel a little less solitary when, after passing for some distance by the bleak shore, I hear a confused shouting just before I come upon a boisterous company of curlers who are enjoying themselves enthusiastically. Curling is well called 'the roaring game'; indeed, its principal characteristic, as I have observed, is that the bodies of its votaries are quite unable to contain their voices! Who would have imagined that that slim stripling with the broom was the possessor of such vocal thunder! or that yonder white-haired Boreas owned such a breezy vocabulary! How the stones fly and the brooms are plied and the woods resound! And how the spirit of Solitude in the form of the swan stands in the distance, aghast upon the frozen lake, terribly conscious of her ungainly feet, poor thing! The merriment is quite infectious, and I would like to shout too, if I dared; therefore I am quite delighted when a curler whom I know comes over and invites me to cross the lake to the other side. So with the help of courage and a plank I venture over the treacherous fringe of water and broken ice, and have the new experience of traversing the lake on foot dry-shod!

I stand on the wooden steps near the curling-house for a moment, and note how the rinks gleam like bars of polished steel as the singing stones glide along swift and straight to the 'tee,' propelled by the hands of the jovial curlers, who look as if they themselves were propelled by steam, so fast and white does their breath escape into the frosty air.

But I must hurry on, for the sky is now quite overcast and the snow is beginning to fall. I hold out my muff to catch some of the radiant crystals, so delicate in purity, so varied in form, as they fall from the leaden sky faster and faster. Soon the hard earth will be covered with a carpet of white silence, and old mother Earth's brown bosom will be warmly robed in the softest of ermine. Now I spin along within a dizzy whirl of driving snow. The world is transformed before my eyes; the rigid black trees are outlined in softest white by the busy fingers of the snow spirit whose fairy argosies, the snow-flakes, are breasting the invisible billows of air laden, not like the thistle-down of August with the malignant thistles of next year's summer, but with a more beneficent freight of fleecy warmth and protection for the many forms of vegetation which are waiting for spring, deep underground.

Faster and still faster falls the snow. I hurry homewards as this belated blackbird is doing,

chuckling vehemently as he flies; for he is Nature's watchman, who must warn all his feathered kindred that their common enemy the snow is also on the wing.

MR ESHOLT'S YOUNG WIFE.

A STORY IN TWELVE CHAPTERS.

CHAPTER IX.

AFTER a fortnight's absence, Mr Esholt found himself at home again. He brought back with him a bad sore throat, which before long developed into inflammation of the chest, confining him indoors without hope of release for some time to come. This illness was especially annoying, coming as it did at such a time, for just then there occurred one of those ominous lulls in the commercial world which, like the intense quiet that often precedes a storm in the aerial world, caused the souls of many to quake within them. It is not well at such times when the captain of the ship cannot himself direct the helm; but Mr Esholt was a man who never wasted his breath in bewailing the inevitable; all he could do was to make the best arrangements possible under the circumstances.

His old and tried head-clerk, Jabez Kimber, would continue to take charge of the business as heretofore whenever Mr Esholt had been absent. Each morning Mr Kimber would send up the letters, or such portion of them as he deemed it requisite that his chief should see, by pony express to Everton; but as Mr Esholt himself was at present unable to use a pen, it became necessary to employ an amanuensis, to whom, after the letters had been read to him, he could dictate the answers, together with such instructions as he might deem needful for the proper conduct of the business during his absence. For this position of amanuensis Mr Esholt selected Wilmot Burrell. As Wilmot lived across the water, and as Mr Esholt would be likely to require his services to answer the late letters in an evening, it became requisite that he should take up his quarters for the time being at Everton. Thus, by a strange concatenation of circumstances, he and Agnes were brought together again. Agnes heard the news with secret dismay.

Neither she nor Miss Esholt could help being struck with the change in Wilmot's looks when, on the evening of his arrival, he entered the dining-room. Short as was the time since they had last seen him, he looked as if he had gone through some great sickness or great trouble in the interim. His cheeks had a hollowness such as they had never shown before; his eyes seemed to have sunk deeper into his head, and there were dark half-circles under them, the outward and visible signs of inward suffering either mental or physical. But his spirits were feverishly gay. All through the dinner he chatted with much animation with Miss Esholt; but he frequently laughed, and that rather boisterously, when no laughter seemed to be called for, and partook of the wine more freely than he had ever done before at Mr Esholt's table. To Agnes he was studiously polite, but nothing more. To

her, that evening it seemed impossible to believe that this was the same man who, but two short weeks before, had told her in such impassioned accents that he loved her. He rose from the table with the ladies and bade them good-night at the door.

Except at the dinner hour, they saw little of him. He breakfasted alone, and after attending to Mr Esholt's correspondence, he went down to the office during the middle of the day, returning about four o'clock. Sometimes, when there was anything very special to consult Mr Esholt about, Mr Kimber would come back with him; but on these occasions the head-clerk, who was of a nervous, fidgety disposition, with an old bachelor's uneasiness when in the presence of ladies, could never be induced to stop to dinner.

About a week after his return, Mr Esholt's illness suddenly developed graver symptoms than had yet shown themselves. Agnes had seen her husband before breakfast, at which time he looked and declared himself to be considerably better than on the previous day. After breakfast she went out to buy some grapes and other articles, and was gone about an hour and a half. On going into the dressing-room which opened into her husband's bedroom, she found Miss Esholt installed there. She was passing through, when the latter held up a finger warningly. 'My brother is asleep,' she whispered. 'He has become much worse during the last three hours. Dr Pyefitt has just gone. He administered a sedative, and has left word that the patient must on no account be disturbed. Until there is a change for the better, I have arranged to nurse my brother in the daytime with the assistance of Davry, and have sent for Mrs Jukes, an excellent person, who nursed him when he was ill two years ago, who will take charge of everything during the night.'

'But in that case, what is there left for me to do?' asked Agnes in dismay.

'Nothing,' responded Miss Esholt icily.

'But, as his wife, it is my duty to remain by Mr Esholt's side; and surely I can help one or both of you in the nursing!'

'Child!' burst out Miss Esholt, her stony self-possession for once deserting her—'and in many ways you are little more than a child—how dare you attempt to interfere in any arrangements I may think fit to make? My brother is very ill. It is imperatively necessary that he should be nursed by skilled hands, by those used to illness in various forms, and who are at home in a sickroom, not by raw inexperienced young women like yourself. What do you know of illness, pray? Whom have you ever nursed? Mr Esholt is as dear to me as a brother as he is to you as a husband—possibly more so. Do you think, then, that I will willingly allow his life to be endangered merely to gratify the caprices of a wilful girl? Not so, Mrs Esholt. You are his wife, and you can of course insist on nursing him; but if you do, will you be answerable for the consequences? I will not. Take the responsibility into your own hands, if it so please you; but remember that should my brother not recover, I shall assert with my last breath that it was your wilfulness and ignorance that killed him!'

At this juncture Mrs Jukes was announced.

As the nurse entered the room, Agnes left it. She was dazed, bewildered, heart-stricken, and yet that terrible woman's terrible words were not to be gainsaid. Of nursing, in the proper sense of the term, she knew next to nothing. Dare she take upon herself the tremendous responsibility Miss Esholt would thrust upon her if she persisted in asserting her position as a wife? No, she dare not—she dare not! Her husband was ill, perhaps dying, and she must be a spectator—nothing more.

It was dusk when she left her room, and a servant was lighting the hall lamp as she went down. During all those hours no one had been near her. Was her husband better or worse? She could rest no longer without knowing. She had a right to go to his room to ascertain that much, even if every other right were denied her. After pausing a moment, she turned to re-ascend the stairs, and as she did so, she saw Wilmot on the landing above, on the point of coming down. He had just left Mr Esholt's room. His face flushed at sight of her, and then became as pale as Agnes's own. Next moment he was by her side.

'O Wilmot, how is he?' she cried, in her anxiety letting the old familiar name slip from her lips. 'Is he better? Has he asked for me? Is there nothing I can do for him?'

'The symptoms have abated, and there is a slight improvement,' he answered gravely.

'Thank Heaven for that!'

'He has even been able to dictate the outlines of two important letters, which is certainly more than he could have done this morning.—By-the-way, I was coming to look for you, Mrs Esholt.'

'To look for me!'

'Mr Esholt has just handed me his bunch of keys with a request that I would see you and ask you to be at the trouble of opening the private drawer in his writing-table, where you will find a certain memorandum book bound in purple leather. This book you are to hand to me, returning me the keys at the same time, of course after relocking the drawer. Mr Esholt specified this one as being the key of the private drawer.'

Wondering somewhat, Agnes took the keys. 'If you don't mind, I will await your return here,' said Wilmot.

'I shall not detain you more than half a minute,' she answered, as she crossed the hall and then turned the corner of the corridor which led to Mr Esholt's study. Wilmot stood without moving where she had left him. He was still very pale, and his teeth were fixed tightly on his under lip, as if to keep down some hidden emotion. 'Will she never come back!' he muttered under his breath, for Agnes, instead of being away only half a minute, was fully three minutes before she returned. One glance at her face was enough. 'She has found it!' he whispered to himself.

'Here is the memorandum book and here are the keys,' she said in a dull expressionless voice, which contrasted strangely with her excitement of a few minutes ago. He took them, bowed, and, without a word, went back up-stairs on his way to Mr Esholt's room. Agnes stood where he had left her till he was out of sight; then she too went up-stairs, slowly, and taking hold

of the baluster as she went. At the top, she turned to the left and went to her own room.

On opening her husband's private drawer in the study, she saw, lying close by the memorandum book of which she had come in search, a torn portion of a letter, to which her eyes seemed involuntarily drawn. It was written in a bold masculine hand; and quite unconsciously, for her mind at the moment was elsewhere, her glance took in one or two of the sentences. At first their sense failed to strike her, then all at once the hot blood crimsoned her face, and she read them again. Then she shut the drawer quickly and turned the key; but having done that, she stood without stirring for a full minute, her mind a chaos of conflicting emotions. Then she deliberately unlocked the drawer again, took out the letter, and read it slowly and carefully through. She read it more than once, more than twice, till, in fact, every word had burnt itself into her memory. Both beginning and end of the letter had been torn away; what there was of it ran as under:

'You are quite right, my dear Esholt, in terming marriage a mistake. I found that out long ago; you, I suppose, are discovering it by degrees. Young wives are kittle creatures to manage. I can fully sympathise with you, now that the first rosy flush of wedded life has faded into the dull light of this workaday world—now that you are no longer bride and bridegroom, but commonplace man and wife. Take consolation from one who has gone through the ordeal. New harness always sits uneasily at first. You say that whatever you may think or feel, you always show a smiling countenance: a wise policy on your part, which I hope.'—

Here it broke off abruptly; but the young wife had read enough. She put the letter back into the drawer, and taking the memorandum book with her, went her way.

Although Mr Esholt grew no worse in the course of the next two or three days, it might with equal certainty be averred that there was little or no change for the better in his condition. But while his bodily weakness was so extreme, his mind was as clear as ever it had been; and as he lay there through one weary hour after another, it was only to be expected that his thoughts should brood much over the disquieting tidings which reached him day after day from the office; and that of itself was enough to retard his recovery. Lying there helpless in the partially darkened room, difficulties which, had he been about and well, he would have smiled at disdainfully, assumed unreal proportions in his eyes, and although he knew in his mind that they were merely as dwarfs masquerading in giants' armour, he had not strength to combat them, but allowed them to torment him at their pleasure, while calling himself a weak fool for not trampling them under foot, as he would have done at another time.

Then, again, he was bitterly grieved at heart at seeing so little of his wife. 'Where is Agnes?' he would sometimes ask when he woke up from an uneasy slumber and looked round with longing eyes for a sight of his young wife's pleasant face. Then his sister would put him off with some commonplace answer that Agnes was busy elsewhere, or that she had just been to inquire

how he was; and would finish by saying that Dr Pyefitt had forbidden all unnecessary conversation. He had not strength to press the point, but would murmur to himself: 'She does not care for me. Why should she? She has loved once, and can never love again!' And then he would fall again into one of his frequent half-sleeps, in which he nearly always seemed to be watching, with a sort of fearful fascination, a huge dark cloud which was slowly creeping up towards the zenith, and ere long would enfold both his fortunes and his happiness in its pall-like embrace.

In the frame of mind in which he then was, his wife's desertion of him—for such he termed it to himself—seemed almost a matter of course; merely one more among the crowd of misfortunes rushing in from every side to overwhelm him. Sometimes, however, on awaking he would find her there sitting by his side, for even Miss Esholt did not venture to keep her always out of her husband's room—and then it was touching to see the smile that brightened his wan face as he stretched out his hand towards her. 'He is only trying to deceive me,' Agnes would say bitterly to herself at such times. 'He wants to make me believe that he still loves me; but after that letter, how is it possible for me ever to believe again?' Then, again, Miss Esholt was nearly always in the room, and that did not tend to set her at her ease. So she would mechanically press her husband's hand and ask him how he was, and sit a little while, gazing with a sinking heart into his worn face, and then hurry out to hide the tears she could no longer keep back.

Neither by day nor night could Agnes get that terrible letter out of her thoughts. She wandered about the great dismal house, pale and sad, like an unhappy ghost for whom there is nowhere any rest. Not a creature in the world was there to whom she could open her heart and unfold her sorrows. Never so much as now had she missed kind-hearted Aunt Maria's comforting presence. Sometimes a wild longing came over her to leave all this weary coil of trouble behind her and make her way to the far-off parsonage where her aunt now lived, and there claim the love, the shelter, and the rest which she knew would not be denied her. Whenever she and Wilmot chanced to encounter each other, his soft veiled glances and melancholy smiles were not lost upon her. They were not like words—she could not take open cognisance of them; and since the finding of the letter, the knowledge that she was still as dear to him as ever sometimes sent a faint momentary glow through her heart, which only served to make the drear reality seem more dreary still whenever her thoughts contrasted it, as it was inevitable they should sometimes do, with the golden possibilities of what might have been. And so the weary days sped slowly on.

At length there came a day—about a week after Agnes's discovery of the letter—when tidings went through the house that Dr Pyefitt had pronounced Mr Esholt to be much better, and that there was every reason to hope the improvement would continue. That same evening Agnes sat down to communicate the news to Miss Maria, knowing how glad she would be to receive it. Finding herself, when she had written her note,

to be out of envelopes, she went down to her husband's study in search of some, feeling sure that at that particular time Wilmot would be engaged with Mr Esholt. She found the room empty, as she had surmised it would be. The lamp was lighted and the curtains drawn. The desk at which Wilmot usually sat was littered with letters and papers of various kinds. There, on the opposite side of the big square table, was the leather-covered chair in which Mr Esholt sat when at work, and there in front of it was the private drawer in which she had found the fatal letter. An archway and *portière* divided this room from the library proper. Agnes having found what she wanted, had just turned to go, when there came a ring at the front door. Who could it be? Probably Dr Pyefitt, who sometimes made a second call about that hour. She heard a servant answer the summons, and then the sound of voices, but whose voices she was unable to judge. As she could not get back to her room without passing through the entrance-hall, and as she did not care to be seen by any possible strangers, who, for aught she knew, might be some of Miss Esholt's visitors, she decided to stay where she was for a few moments till the coast should be clear.

Scarcely had she come to this conclusion when she heard voices in the corridor—those of Wilmot and some stranger—and was dismayed to find that the speakers were coming in the direction of the study. She had just time to push aside the *portière* and glide through into the library beyond, when the study door was opened and Wilmot and the stranger entered. The library was in darkness; but Agnes at once made her way noiselessly towards a door at the opposite end which opened into a side corridor from whence she would be able to get back unobserved to her room. Her heart gave a great throb when, on trying this door, she found it locked, and locked, too, from the outside. Her only means of escape was cut off! While she was standing in dire perplexity, not knowing what to do next, she heard the stranger say: 'I suppose we have nothing to fear from eavesdroppers?' To which Wilmot replied: 'Nothing.' Then he strode across the room, drew aside the *portière* and peered for an instant into the darkness beyond. Agnes, who was wearing a black dress this evening, had barely time to sink into a recess between two bookcases. Then the *portière* fell back into its place, and all was darkness again.

ON 'CHANGE IN MANCHESTER.

It may interest some of our readers to have a slight sketch on the above subject from the pen of one who has attended daily for the past quarter of a century on the boards of this the greatest emporium of commerce in the world; indeed, it may be said without fear of contradiction that the Manchester Royal Exchange is the largest hall ever constructed and used for purely commercial purposes. The capital invested in the building, which is divided amongst about two hundred and fifty shareholders, is nearly three hundred thousand pounds; and being practically a monopoly, the dividends range higher than on consols, while the security is considered by many almost as good. It is a vast and noble building, constructed in the

Italian style of architecture. The main entrance is approached by steps to the height of fifteen feet above the street-level, thence leading through a magnificent portico, containing four hundred and sixty square feet; which is enclosed within twelve massive stone pillars, about sixty feet in height. At the north-east end of the building there is a stately tower one hundred and eighty feet high, and containing a fine clock. On entering the building at an early hour of the day, when it is almost empty, one is then most struck with its vast extent. Above us, the roof is crowned by three great domes, panelled with stained glass, the central one reaching to the unusual altitude of one hundred and twenty-five feet from the floor-level; those on either side to forty-five and sixty feet respectively. Around us there is an unobstructed walking area (except for the columns) of nearly forty thousand square feet, consisting of a vast nave—flanked on either side with Corinthian columns of Irish red marble—and three spacious aisles or arcades. At the farther end of the building, opposite the main entrance, about thirty-five feet above the floor-level, there is an ornamental semicircular balcony, into which the Master of the Exchange escorts distinguished visitors, in order that they may witness the extraordinary sight presented at the time of 'High 'Change.'

Extending down the whole of the left wing, and some fifteen feet above the floor-level, there is a commodious reading-gallery, framed and enclosed from floor to roof with glass panels, which looks into and commands a continuous and comprehensive view of the hall below, and it is from this gallery really that the best observations can be made, and where the babel of noise is so hushed that you might almost suppose you were in a separate building. This reading-room is supplied with the principal newspapers and magazines of the United Kingdom, and includes also others published on the Continent, in the colonies, in North and South America, and British India. There are no fewer than one hundred and six magazines of monthly issue on the tables.

Ranged along both aisles of the building there are a series of 'drums,' where the numerous telegrams constantly arriving are promptly posted up, and which contain the latest commercial, political, and general information, comprising the last quotations in general produce, iron, corn, and copper; the latest movements in the Liverpool and New York cotton markets; the latest intelligence of imports and exports; semi-daily reports from New York, Liverpool, London, Glasgow, and Manchester Stock Exchanges. There are also two telephone departments—one at either end of the building, the principal one containing fifteen telephones; the other, five; beside which, there is a separate telegraph office; while high above the main entrance doors there are to be seen in large letters the opening price of 'consols,' the 'Bank rate' of the day, and the opening and closing 'estimate' of the total sales of cotton in Liverpool during the day.

Ensclosed within the side aisles and spread throughout the building there are some forty enclosed writing-desks, affording privacy for the transaction of business; besides perhaps twice as many marble slabs furnished with writing materials for the same purpose.

For the purpose of general observation, let us enter the Exchange at about half-past one to two P.M., along with the hurried and impetuous multitude who are now rapidly pouring into the building, and by two o'clock we may find ourselves in an assemblage of between six and seven thousand persons; and on looking around us, we shall discover more eager eyes and anxious faces than we have seen for some time. There is not the gesticulation and facial contortion of the Paris Bourse, or the frenzied excitement witnessed in Wall Street, New York, but there is a suppressed intensity and earnestness of purpose visible in every face. You may search long for a tranquil and serene expression of countenance, and, indeed, no wonder, when we consider the magnitude and keenness of the contest in which all here assembled are engaged. Meantime, if we can only retain our mental balance amidst this hum of human voices and bewildering movement of human hands and feet, let us ascertain if we can who these individuals are, and what is the precise nature of their business here.

First in order, then, there are the agents for the sale of raw cotton representing Liverpool or American firms; then the representative of the spinners of the raw material into yarn and thread; then the salesman of the manufacturer, or the manufacturer himself, who weaves this yarn into cloth—each of these is eagerly in search of the buyers of each commodity. Next in order, though less numerous, there are the spinners and manufacturers of linen, silk, jute, worsted, and multitudinous mixed fabrics for clothing purposes. These are supplemented by the dyers, printers, finishers, and bleachers of these and the varied cotton productions. These are again augmented by dealers in coal, iron, tin, timber, copper, steel, and their resultants in the form of machinery, constructive plant, &c. Besides all these, there is quite a small army of agents for life, fire, and marine insurance (stock and financial brokers, a few), dealers in agricultural and other produce, such as indigo, flax, flour (for sizing purposes), chemicals, drysaltery, &c., *ad infinitum*.

Let us observe a little of the methods of the crowd around us. Here is a salesman of yarn or cloth, who has probably called upon a number of firms at their places of business during the morning, and given them patterns and prices, and is now anxiously seeking them out again for the purpose of final conclusions; and after succeeding in his search, books in hand, both buyer and seller are apparently endeavouring to come to terms. Elbowing on as best we may, for the hall is densely packed in most parts, and getting gradually more accustomed to the almost deafening hum, let us endeavour to hear what is being said on the part of buyer and seller, and we shall probably catch such jerky utterances as the following (in the cotton quarter) from the seller: 'Cannot be done, cannot possibly take less.—Very lowest price.—We are losing money.—Working under cost.' Or again: 'Will take it as an offer and submit.—Will consider it and report.' Or again: 'Market is strong in Liverpool; twenty thousand bales sold to-day.—Shall want more next week!—Cannot possibly hold it over'—meaning, if the bargain is not struck there and then, quotations will not be considered binding an hour afterwards.

On the other hand, from the buyer we may hear such expressions as: 'Cannot give a fraction more!' or, 'Cannot buy to-day.—Bad reports from abroad.—Exchange is down'—meaning, rate of exchange is adverse to remittances from abroad, therefore business must be temporarily suspended.—'The cotton crop is under-estimated'—indicating a plentiful supply of raw cotton in the coming season, and consequently lower prices.—'Will submit your price out'—meaning, will write or wire out to India, China, or South America, &c. (Wiring is more general to India and China, and is of daily occurrence.) 'Cannot possibly exceed our limits.—If you don't accept, order will go back'—meaning, order will be sent back unexecuted for fresh limits, which may or may not be forthcoming, and involving a delay for which the needy spinner or manufacturer with machinery unemployed cannot afford to wait.

Then, again, there are to be heard endless discussions as to the fulfilment of contracts already entered into—discussions arising out of either inferiority of quality delivered, or lateness of delivery beyond the contracted time; and these disputes are often very excited and acrimonious; as of late years, in consequence of the intense competition, contracts of any magnitude are made legally as well as morally binding by the signing of the contract by both buyer and seller; thus bringing any default in execution within the statute of frauds. These difficulties have recently (when they have become too strained for settlement otherwise) been saved from the law-courts by mutual reference to the local Chamber of Commerce, as a better informed and less costly tribunal, and this has been found to work satisfactorily in the interest of all parties concerned.

An attendance on the Manchester Exchange supplies serious matter for reflection on the intensity of the struggle for the maintenance of our established industries against the strain of foreign competition; as, beyond doubt, this struggle is getting daily keener and more severe. In proof of this, it may be stated that continental and American cotton goods in large quantities are frequently sold here both for home and foreign consumption. In American productions, the bargains are made at so much per piece, freight and packing free in Bombay harbour, being the goods trans-shipped at Liverpool on the way from New York to Bombay. To give an idea of the strained condition of things resulting from this intense competition, it is not unfrequently the case that a bargain falls through because of a difference of one sixty-fourth part of a penny per yard between buyer and seller. The struggle is demoralising to all concerned; high moral principles are being rudely shaken under it, the grand old motto, 'Live and let live,' finds itself in an uncongenial atmosphere. *Au contraire*, the cry against this is, 'Live who live can;' it is 'diamond cut diamond;' the weakest goes to the wall, without the element of mercy in the conflict.

A few words in concluding this sketch of the Manchester Exchange as to the magnitude of the business transacted daily—especially on Tuesday and Friday, the market days—on these boards. In monetary value it is quite impossible to arrive at anything approaching a trustworthy estimate, and it is perhaps only in cotton yarn and cloth that the total turnover may be reasonably approxi-

mated; and when this is formulated and stated in aggregate as well as comparative terms, the figures will appear absolutely incredible to an outside observer, and may possibly at first sight be doubted even by many who attend here regularly. There are many days, and it may be safely said to occur at least once a week in busy times, when the total sales of cloth effected during the day amount to twelve million yards, and when the total sales of yarn reduced into single threads would be long enough to girdle the globe sixteen hundred times successively; or be equal to five thousand times its equatorial or polar diameter; or reach from this planet to the moon one hundred and eighty times in succession; or be equal to nearly twenty thousand times that luminary's linear diameter. Or, again—to continue the comparison—it would be sufficient in length to reach almost half-way to the sun; or be equal to over fifty times its diameter; and would be sufficient to cover three-fourths of the distance to the planet Mercury when nearest to us; and almost equal to twofold the distance of Venus when in inferior conjunction.

About three P.M. the hall becomes less crowded owing to the exit of large numbers, many of whom return again an hour later, and remain till close on five P.M., after which the building is almost entirely vacated, and again presents, as in the early morning, that unique and striking appearance of spaciousness which is largely due to its extraordinary dimensions, and which is intensified by the absence of obstructive fittings and furnishings, usually found in most other buildings.

It may be well to state how the estimates given are roughly arrived at. Taking the sales of raw cotton in Liverpool at the moderate total of ten thousand bales for the day, and adopting the not improbable assumption that at least this quantity is sold in the shape of yarn and cloth on the same day, and averaging these bales at three hundred pounds each (a fair average), we get 3,000,000 pounds of cotton; and taking the counts of yarn spun from this cotton at, say, 'thirties,' warp or weft (a fair estimate), and multiplying 3,000,000 by eight hundred and forty (yards to the hank), and then by thirty (hanks to the pound), we get 75,600,000,000 yards of yarn, which, being divided by seventeen hundred and sixty (yards to a mile), gives us nearly 43,000,000 miles of yarn.

MR MAGSDALE'S COURTSHIP.

IN FOUR CHAPTERS.

CHAPTER II.—AN UNFORESEEN DIFFICULTY.

THE day fixed for Allan Magsdale's departure from Astley Villa had arrived, and Peter was saying his farewells with a lugubrious countenance. His cousin had secured lodgings in Holland Park Road, no very great distance geographically; but for all the assistance he could be there, he might as well have taken up his residence at the North Pole. Hence unbrotherly feelings raged in Peter's mild breast against the sister who had brought about this separation.

'You will come and see me sometimes?' he said for the tenth time, as Allan stepped into his cab.

'Oh yes; I won't lose sight of you.—Let me know how you get on up at Queen's Road.'

Alas, poor Peter! How was he to 'get on' at

all, when Cornelia would be always at his elbow? Miss Cressburn's occupation kept her abroad all day, or he might have snatched an occasional holiday to spend in her society; and he knew that his sister would not accept any excuse he might invent for going out night after night, as had been his habit when Allan was with them. He half wished that he had not been quite so hasty in proposing to Mary. Now that they were actually engaged to be married, she was justified in expecting him to be frequently with her; and unless he told her how he was situated, it would be hard to give a satisfactory explanation of his remissness. It was very perplexing; and, like all weak men, he took refuge in a resolution to wait and see what time would do for him.

He thought the matter over carefully, and came to the conclusion that his first aim must be to disarm Mrs Bunshaw's vigilance; to make a show of resigning himself to the humdrum life she considered proper, before attempting to begin operations again. The plan answered admirably in its direct object; but it was not long before he discovered that he could not satisfy Miss Cressburn with promises, and within a week of Allan's departure he found himself fairly confronted with the difficulty. He had received her second letter asking him to call, and its terms forced him to confess that the young lady would have just reason to complain of his behaviour unless he promised to go and did go.

'I shall be at home about half-past eight this evening,' wrote Miss Cressburn, 'and won't accept any excuse for your non-appearance. You needn't plead an engagement, as you did last time. If you cared to see me, you wouldn't make engagements at the only time I am at leisure.'

'It's very clear that she's not to be trifled with,' thought he, as he read the letter in his office. 'I must say I'll go, and trust to luck to manage it.' He wrote and despatched his reply at once, and passed the day wondering how he was to fulfil the promise he had made. His good angel sent him succour in a very unexpected shape. On his return to Putney that afternoon, he found Miss Terripeg with his sister; and Mrs Bunshaw's first words showed him the means of keeping his promise without the least risk of trouble. 'Miss Terripeg is going to remain to dinner with us, Peter,' she said; 'and you must walk home with her afterwards.'

Since the day on which Mrs Bunshaw had suggested that this lady was of all others the one best qualified to make him happy, Peter had given her as wide a berth as he could; nor, so long as Allan had been in the house, was there any difficulty in avoiding her. She was a brisk, dark-haired little person of about his own age, with an endless flow of very small talk, and a degree of admiration almost amounting to worship for Mrs Bunshaw, whose character and principles she took every opportunity of extolling. Her manner to Peter was one of confiding tenderness, painfully embarrassing to a man of his shy temperament; and as his sister gave her every encouragement to continue this mode of treatment, with tactless disregard for his feelings, it is not wonderful that Peter met her with very moderate joy.

But she would want him to walk home with her after dinner, and that materially altered

matters. His heart bounded with relief and eagerness, for she lived in the direction of Queen's Road, and she was sure to go home early. He received her with unusual warmth, and made light of the task his sister had imposed upon him; nothing would give him more pleasure than to see her home, and in saying this he was at least sincere.

'Well, I never expected help from that quarter,' reflected Mr Magsdale as he went up-stairs to his room. 'Odd that it never occurred to me before—very odd.' He went on with his dressing, and as he did so his thoughts took a wider range. 'There's no earthly reason,' he said to himself as he struggled into his coat—'no earthly reason why Miss Terripeg shouldn't come here every night of the week, so that I could walk home with her. At all events, I'll do my best to encourage her visits as often as I can.'

It was a new thing for Peter to plan an elaborate scheme to impose upon any one, and although in this instance everything seemed to be in his favour, he went down-stairs to join the ladies somewhat dubious about his ability to carry it through. He made a very creditable beginning, however, and fairly astonished his sister by the brilliancy of his conversation and the assiduous attention he paid to Miss Terripeg's wants at dinner.

'Peter is positively coming out, my dear,' she observed to her friend when they were alone in the drawing-room. 'I never knew him to be so entertaining before; he doesn't exert himself like that for me.' This was strictly true, but hardly fair, for Mrs Bunshaw's usual demeanour was not calculated to excite hilarity in one who held her in such awe as did her brother.

'You can't mean that I am the cause of his high spirits,' said Miss Terripeg.

'I didn't say that your presence had anything to do with it; I only said that he is never so cheerful when we are alone.'

'I wish I could think so,' sighed the lady, pursuing the tenor of her own remark. She really liked Peter, and his sister's candidly expressed desire to create her a relation was treasured in her memory.

'I hope we shall often see you here now; we found our cousin rather—rather undomestic, and were very glad when he left us; I could never depend on having Peter at home any day,' said Mrs Bunshaw with meaning.

Cornelia thought her brother's solicitude lest they should detain Miss Terripeg unduly late was a little out of keeping with the pleasure he appeared to take in her society; as a matter of fact, he had to exercise some self-control to refrain from looking at his watch every five minutes, after the clock in the hall struck eight. It was nearly nine before the guest thought of moving, and past that hour when her leave-takings with Mrs Bunshaw were concluded. The night was cold, and Mr Magsdale's fear lest his companion's health should suffer was no doubt the reason which prompted him to start on the journey at a good round pace of about five miles an hour.

'I must say I enjoy a smart walk on a night like this,' he said pleasantly.

'Yes,' panted Miss Terripeg; 'but—do you think we—need go quite—so fast?'

The discomfited Peter slackened his speed, and explained that he thought she was in a hurry to get home. But she disclaimed the idea of being in haste to lose Mr Magsdale's company—a pretty speech which was thrown away on him, for he was engaged in a mental calculation of the time he must lose in going home with her instead of making his way direct to Queen's Road.

'I love the night,' said Miss Terripeg softly when she had quite recovered breath; 'it seems to me that one's noblest thoughts and highest aspirations are born of the darkness.' Her tone was so alarmingly tender, that Peter felt a little apprehensive, and conceived the noble thought of checking further conversation by increasing his pace again. 'If she begins *that* kind of thing, I must,' he decided in consternation; 'I shouldn't know how to make her stop it.'—'I daresay you are right,' he answered vaguely; and Miss Terripeg, finding him as insensible to poetry as he was to flattery, altered her strain, and proceeded to chatter volubly about Mrs Bunshaw, her talents, her work, and the admiration she commanded.

'How could you get on without her, Mr Magsdale?' she cried enthusiastically. 'So kind, so thoughtful, so attentive to your comforts and happiness.'

'I don't know, I'm sure,' said Peter, wistfully thinking how well he could take care of his own comfort and happiness if Cornelia would only give him a chance.

'Yes, it must be sad for you to think that she cannot always remain with you.'

As Peter's chief sorrow in life was that the future offered no trustworthy prospect of his ever being without her, he could not respond to this very cordially.

'I am devoted to Cornelia,' said Miss Terripeg warmly. Of course her brother must be devoted to her also, and she wanted to find some common ground of sympathy with him.

'I hope you will come and see her frequently,' Miss Terripeg said Peter as gravely as though his sister was *in extremis*, 'and give me the pleasure of walking home with you.—Ah! here is your door.—Good-night.' He evidently feared to linger over the pleasure, for he was out of sight down the street almost before she could ask him to come in and sit down for a few minutes.

'A little eccentric,' she said to herself as she went indoors; 'but a very nice fellow indeed. I must go and see Cornelia again about the Society's meeting, soon.'

Although love lent wings to Peter's heels, he did not reach Mary Cressburn's door until nearly ten, and he hastened up-stairs with some misgivings as to the reception he might expect. His apologies were very graciously received, however, and he settled down to make the most of the short time he considered it safe to prolong his absence. He spent an hour with her, and left the house with sufficient food for reflection to last him a much longer time than he cared about.

Miss Cressburn was quite willing to marry him immediately, if he wished it, but insisted on knowing his reason for such unnecessary haste. Peter beat about the bush for a while, and when finally cornered, admitted that he feared opposition from his 'family,' to whom he dreaded giving offence on account of his expectations. Mary

Cressburn, who had her full share of proper pride, was roused, and declared her wish to be introduced to his family. Peter strongly demurred; he was much afraid that such a step would lead to a rupture, which might be avoided if she waited until after their marriage to make its acquaintance. Nothing the family could say then could untie the knot, and it might reasonably be expected to resign itself to the inevitable. It was plausibly put; but Mary was by no means satisfied. Was Peter ashamed of her? He made the only answer he could. Well, then, if he was not ashamed of her, she must have a better reason for his disinclination to let her meet his friends. Peter looked helpless and miserable, but had no other reason to give. Then he must distinctly understand that their wedding need not be discussed at all until she knew every member of his family; she would never have it said that the man she loved had been disinherited by reason of his secret marriage with her. She wanted everything done openly and in the light of day. If the family did not approve of his choice, then it would be for him to decide upon his course, whether he elected to throw over his relations or herself. She spoke bravely, though she felt with a sinking heart that she was insisting upon a condition which might wrest her lover from her, and leave her to the life of toil and drudgery from which she longed to escape. It could not be helped, and she would not abate a jot of her demand whatever the consequence might be.

To look at it from another point, it was only right and just that she should know everything about the man with whom she had consented to cast in her lot. That was the view Miss Parkins would take of it, and no one could gainsay its correctness. Her aunt was the only relative she had, and Mary held her in deserved esteem. She was a clear-headed, sensible old lady, who guarded her niece's interests with almost motherly care. She was not the woman to consent to such a proposition as Mr Magsdale had made, and it was altogether out of the question to consider it seriously for a moment.

So Peter left Queen's Road in full possession of Miss Cressburn's opinions, feeling that from their very soundness they served to raise another obstacle in a path which had been difficult enough before. He had consistently referred to Cornelia as the 'family,' a prevarication of which he was not a little ashamed, and which did not simplify matters, now that he recognised that Mary meant to know his belongings before she would consent to marry him.

The 'family' looked curiously at her brother when he came in, but having drawn her own deductions from his lengthened absence, forbore to question him about it. She had no doubt in her own mind that Peter and Miss Terripeg had taken advantage of the beauty of the night to go for a little walk together, instead of proceeding straight to the lady's residence. A violation of the rules of propriety, but one which she was disposed to overlook under the circumstances.

'I like Anna Terripeg,' she remarked as he took his seat beside the fire; 'she always seems to enjoy being here too.'

'Yes,' said Peter heartily; 'she's a cheery, companionable little woman. You must ask her

in again soon. I can always take her home, you know.'

Mrs Bunshaw smiled a little triumphant smile and nodded wisely. 'Quite so, Peter,' she said dryly—'quite so.' And she went up-stairs, picturing her brother and Miss Terripeg already facing each other at the altar.

'I hope Cornelia's notion won't lead to complications,' reflected Peter as he stirred the fire into a blaze. 'I suppose I must let her keep it for the present, if I am ever to see Mary at all; for, upon my word, the only way I can get out of the house without being badgered to death about it, is on the pretext of taking Miss Terripeg home.'

A few days passed by, and he heard nothing from Miss Cressburn. Her silence made him uneasy; for it served to impress upon him that she was in earnest about being introduced to his relations, and though the matter was ever present in his thoughts, he had not yet been able to decide upon the course he ought to pursue. There seemed to be nothing for it but to wait as patiently as he might for the situation to develop itself; though, unless something very unexpected should transpire, he could not fail to see that the affair would be at a dead-lock.

'Miss Terripeg is coming over to spend the afternoon with me, Peter,' said Mrs Bunshaw one morning soon after the occasion upon which he had discovered the advantage to be gained by escorting that lady home.

'Spend the afternoon?' he said doubtfully. 'You had better ask her to stay to dinner, hadn't you? It's a long way for her to come.'

'I'll ask her,' said Cornelia. She had been wondering whether her brother would make the suggestion, and received it in silent contentment. As luck would have it, Mary Cressburn selected the same day to write, asking him to come in and see her that evening at the usual hour. He lost no time in sending an answer, but he qualified his promise to go; for if anything happened to prevent Miss Terripeg staying to dine with them at Astley Villa, he might be unable to get away. So he said that an important engagement, which he was bound to keep, would probably detain him, but he would of course do his utmost to come to her at the appointed time.

Miss Terripeg remained to dinner, and Mr Magsdale made ready to take her home afterwards; less cheerfully than he had done last time, for he was far from happy about the interview he was about to have with his fiancée. The route to Miss Terripeg's dwelling took them across the end of Queen's Road; and as they passed under the gas-lamp at the corner, Peter noticed a woman stop to look after them. It crossed his mind that the figure resembled that of Miss Parkins, but he could not be certain. He reached his real destination soon after leaving his charge at her own door, and was surprised to hear that Miss Cressburn had retired and would not be able to see him; he began to think there was something amiss, and the coldness with which her aunt received him did nothing to relieve his apprehensions. She cut short his inquiries about her niece and put him on his trial at once: we use the expression advisedly, for he felt far more like a criminal than a lover before Miss Parkins had done with him.

'I happened to be out posting a letter this evening, Mr Magsdale,' she began gravely. It was a very commonplace thing for any one to do, and if Peter had brought a clear conscience with him, the information would have appeared unworthy of the solemn tones in which Miss Parkins offered it. That *was* her figure he had seen near the pillar-box at the corner, when he passed with Miss Terripeg. It was not his practice to take evening walks with his lady-friends, and in the position he stood towards Miss Cressburn, it would have been particularly unbecoming; he felt this, and being a modest man, he blushed.

The blush was not lost upon Miss Parkins, and she continued more gravely than before: 'Mary has told me of your disinclination to introduce her to your family, Mr Magsdale.'

Peter would have given fifty pounds to have been on the safe side of the hall door, but there was no escape for him; he wriggled uneasily in his chair, and said: 'Yes, Miss Parkins,' in a hollow whisper, which in itself would have convinced any jury of the speaker's guilt.

'I thought at the time it was curious; but after seeing you with that lady this evening, it occurs to me that you are concealing something from my niece.'

'It was only a friend of my sister's whom I was taking home,' burst out Peter. 'I—I often take her home in the evening.'

'I presume that was the important engagement you feared might prevent your coming here to-night?' said Miss Parkins with cutting irony.

What an awful mistake, he now saw, he had made to say that in his letter. He was not a ready man; and the light in which his conduct appeared to Miss Parkins so overcame him that it did not strike him to give the perfectly reasonable explanation of it which the simple truth would provide. His sister had asked a friend to dinner, and common civility required him to be present; the lady had a long way to walk home, and ordinary politeness required him to escort her. Could anything be clearer?

Unfortunately for Peter, his judge did not give him time to collect himself, but summed up and delivered sentence without even going through the usual formality of asking if the prisoner at the bar had anything to say.

'You come here, Mr Magsdale, and entangle the affections of a young and innocent girl, and then propose a secret marriage to her. You are discovered making an "important engagement" with another lady, a fortnight after she consents to marry you.—I don't want to hear a word, Mr Magsdale,' said the judge, raising her voice to drown his expostulations. 'I told Mary at the time that I didn't think you were good enough for her; but she liked you, and it was not my business to make objections. However, until you are prepared to present her to your family as your intended wife, you need not come here again. But please bear in mind that Mary is my niece, and that you will have me to deal with, if you try to play fast and loose with her.—Now, you had better go.'

Miss Parkins rose as she concluded, and motioned Peter to the door. Even then, he might have cleared himself to some extent, but his weakness was paramount, and he set the seal on the proof of his guilt by walking silently from the

room and out into the street. The matter had come to a crisis, and he knew that if he meant to adhere to his engagement, he must bow to Mary Cressburn's will, and take her to see his sister; and what the result of such a proceeding would be he did not care to contemplate.

'If she only knew Cornelia, she wouldn't be in such a hurry to make her acquaintance,' he groaned. 'I'll have to say that I'll introduce her: there's nothing else to be done.'

And indeed, when he reviewed the events of the evening, it seemed to be the only way out of his difficulties, although he could not see the end of it and knew not whither it might lead. The manner in which circumstances had conspired to drag Miss Terripeg into the game, too, was singularly unfortunate. He had done his little best to have that lady invited to Astley Villa, giving his sister to understand that he welcomed her for her own sake, and wished to improve his acquaintance with her. In plain language, he had taken advantage of the plans Mrs Bunshaw had so long cherished, to make a tool, for his own purposes, of a woman who liked him. He had succeeded so well that it would now be doubly difficult to confess that he had betrothed himself to another. Miss Parkins had treated him very unfairly about Miss Terripeg in connection with the 'important engagement' mentioned in his letter; but he could disabuse Mary's mind of any suspicions she might have on that point, and as soon as he reached home he sat down and wrote to her. He gave the explanation her aunt had not allowed him a chance of making, and begged her to believe that he was concealing nothing from her. He went on to say that he would introduce her to his relations, since she made such a point of it, and concluded by asking her to see him and hear everything he had to say.

To this Mary Cressburn promptly replied; she accepted his statement with regard to Miss Terripeg, but warned him that she could not consider any engagement wherein a lady was concerned of sufficient importance to interfere with his duty towards herself for the future. She would be glad to see him as soon as he could call, and they would arrange a day for her visit to Astley Villa.

It was the answer Peter might have expected; but even as he had written in haste, he now repented at leisure. He could not withdraw his promise to make her acquainted with his relations; but before he went to Queen's Road again, he would see Allan and obtain advice from him.

AN OLD NEWSPAPER.

'DOCTOR,' said the old housekeeper at the Manor-house, when I called a day or two after her master's funeral to ask how she was—'Doctor, I was turning out an old cupboard in the parlour yesterday, and among a pile of bills and receipts I came across an old newspaper; and, thinks I, this will just do for Dr Salisbury.'

'Your thought was a good one,' said I; 'there is nothing that I enjoy more than an old newspaper; and there must be something worth reading in this one, or your master would never have taken such care to preserve it through all

these long years, for it bears date November 9, 1805.'

'And, of all odd things in the world,' she added, 'where should I find it but inside of an old sailor's cocked-hat as once belonged to poor master's grandfather!—him that was shot aboard Nelson's ship in the fight agan the French.—Many's the time I've heard master talk of Captain Frank.'

And so, away I went with my prize. I was too busy that day to examine it with any care, until evening found me as usual in my study, with the curtains drawn and my chair not far from a blazing wood-fire, pen and ink close at hand, and the old newspaper carefully laid out on the table before me. There it lies, one single sheet, twenty inches by fourteen, of old thin paper, gray with age, and frayed at the edges, and bearing date, Truro, November 9, 1805—the *Royal Cornwall Gazette*, then the chief newspaper for all the west country, and not inferior to the *Exeter Gazette* itself. Mr Thomas Flindell appears to be printer, publisher, and editor; and it is he who announces to his readers the sad calamity which had befallen the nation, in these portentous words: 'We have this week to announce a battle more tremendous, and a conquest more glorious, than ever the proud annals of England could boast till now. But LORD NELSON is no more; his ardent soul has departed to heaven on the wings of VICTORY. Four thousand Britons killed and wounded. All faces seem to be in mourning for our gallant and ever to be lamented Admiral; 'tis a dear-bought victory.'

This was the tremendous battle and splendid victory of Trafalgar, where the French fleet, of thirty-three ships of the line, four frigates, and two brigs of war, sailed in triumph out of Cadiz to meet the twenty-seven ships of the line, with four frigates, under Horatio Nelson; and after a bloody engagement of four hours, met with total and disastrous defeat. Nineteen of the enemy's ships were taken or sunk, one was blown up, and six were wrecked in the gale that came on at sundown, after the fight on the 21st of the preceding October. 'But not one of His Majesty's ships,' says the despatch, 'was lost in this most glorious conflict.'

This grand and important news, for which all England eagerly waited, was brought to Falmouth on the 4th of November by Lieutenant Lapenotiere, in the *Pickle* schooner, and thence carried, as fast as post-horses could fly, direct to London, which it reached at midnight of the 6th. At one A.M. the good news was published at the Admiralty, where long before daylight vast crowds assembled to gather tidings of the great fight, and the terrible list of the brave fellows who had perished in defence of their country. The early mails of that morning were crowned with laurel ere they left the Post-office in St. Martin's-le-Grand and carried the message far and wide throughout the land—horses, men, carriages, all decked with branches, flowers, oak-leaves, and ribbons. The whole street, says a spectator, is filled with a double line of royal carriages; and every moment are shouted aloud by Post-office servants, and summoned to draw up, the names of the great ancestral cities known to history through a thousand years—Lincoln,

Winchester, Gloucester, Oxford, Bristol, York, Edinburgh, Glasgow, Perth, Stirling, Aberdeen. Every moment you hear the thunder of lids locked down upon the mail-bags; and every swift departure is crowned by enthusiastic cheers of the crowds that have gathered to join in the triumph. So flies the message of mingled joy and grief, to tell the nation how nobly her sons did their duty in the day of the great sea-fight—how the proud boasts of the invader had been scattered to the winds, the tyrant Bonaparte crushed; and how dearly victory had been bought in the death of Nelson, and the thousands of other gallant souls who shed their blood to win it.

The engagement began at noon at the hoisting of the famous signal, 'England expects that every man will do his duty;' and after raging for an hour and a half, as Nelson stood on the quarter-deck and was pointing out to his officers the gallant way in which Collingwood had brought his ship into action, he received his fatal wound in the breast from the mizzen-top of the *Redoutable*. Captain Hardy had vainly implored him on that day to change his dress, or to cover the stars which he usually wore on his breast; but Nelson replied: 'In honour I gained them, and in honour I will die with them.' Into the fight, therefore, he went, as usual, in his admiral's frock-coat, bearing the four brilliant stars and orders, arranged diamond wise **, and thus became an easy and conspicuous mark for the French riflemen. His last words were: 'Thank God, I have done my duty.'

The terrible conflict was continued for more than two hours after his death, when the last of the French ships struck her colours, and the victory of Trafalgar was achieved.* The last public words of the great minister William Pitt, on hearing the news of the victory and death of Nelson, were: 'Let us hope that England, having saved herself by her splendid courage, may save Europe by her example.' Saved, indeed, England was; but for many a long day the nation mourned for the thousands of brave Englishmen who perished at Trafalgar; and Mr Thomas Flindell might well say: 'All Plymouth faces seem to be in mourning.'

Before parting with our Old Newspaper, it is curious enough to note how differently it is made up from a newspaper of our own busy times. Strictly speaking, there is no Leading Article, three-fourths of the whole space being filled with short paragraphs relating to Trafalgar, letters, and despatches. Advertisements are very few in number, and among the few only a single one relating to literature; that of a book, price four shillings and sixpence, *War in Disguise, or the Frauds of the Neutral Flags*; and among the others, a notable one asking for 'Tenders for Building a Prison on Dartmoor capable of receiving five thousand prisoners of war.' Only two touch on the question of drink—one in which Mr Crowgey

* The bullet which killed Nelson is still treasured as a memento. On removing it from the wound, it was found to have embedded in it a portion of gold lace as firmly as if inserted in a molten state. Mounted in crystal and silver, it finally passed into the possession of the late Prince Albert.

of Falmouth offers 'The Only Geneva, at very moderate prices;' and a second, also from Falmouth, offering 'French Brandy imported direct from France'—those being the days when Cornish smuggling was at its height. Brandy was cheap enough in those days; but the price of wheat in Mark Lane, on October 26, 1805, was fifty-eight to sixty-eight shillings, fine quality seventy to seventy-four shillings, per quarter; though, strange to say, at the same date it was selling in Truro market at thirty-seven shillings per bushel, a difference which I cannot attempt to explain. Its price in Winchester and Mark Lane is now thirty-eight to forty shillings. 'Consols' were in those November days at £59, 14s., just three-pence higher than in June 1815, when, up to the date of Waterloo, they stood at £59, 13s. 9d.

Further than this, the *Cornwall Gazette* has not in it a particle of news worthy of note; though the editor does his best to chronicle the exact state of wind, weather, and tide at all the great sea-ports on or about November 1—that is, a week before the date of publication. But in his special column, he adds, by way of startling information, 'two curious facts'—one, that 'a cornstack in the dreary regions of Borrowdale, Cumberland, has excited the utmost surprise of the natives, it being the first stack of grain ever seen there by the oldest inhabitant;' and the other, that 'hopes are at this moment entertained that the Cape is in our hands, as the governor is a Dutchman well disposed towards England.' The Cape of Good Hope was, however, not ours until taken by Sir D. Baird and Sir J. Popham in January 1806.

With this final morsel of news, we must take leave of our old newspaper, of which we are inclined to doubt there being another copy in existence.

LITTLE BOW-LEGS.

It certainly was a dreadful day for the middle of March: the sleet was being driven in clouds along the streets by a keen east wind, and roads and pavements were deep in slush. Nurse Grant paused just within the threshold of a small house in Old Road, Stepney, to unfurl her umbrella and gather up her skirts. 'I will call again this evening, Mrs Evans; but I think the danger is past for the present, and you need not be uneasy.'

'Thank you, nuss, I'm sure. Please God, things will go better now.'

'Well, I really think she is round the corner; but be sure she takes plenty of nourishment.—Good-morning.'

'Oh, nuss, I nearly forgot, so I did! Will you just call at No. 9 and see Little Bow-legs?'

The nurse nodded; she was already out in the street, and the wind would have drowned any verbal reply. Her black veil was blown across her face, her umbrella creaked with the strain upon it, and nurse gave a little shiver as she hurried along, pushed on by the wind as by unseen hands. When she reached No. 9, she gave a sharp double rap at the knocker, and then watched a grating in the pavement to the left. A face appeared below it presently, and nurse nodded; a moment after the door swung open, and nurse dived into the welcome shelter.

'Very dark down-stairs to-day, isn't it, Miss Moses?'

'It is so, nurse; but I'm glad all the rooms are let.'

'I'd rather have one up-stairs room unlet, I think, and get more light and air. I wonder I don't have you for a patient, living in a cellar like that;' and nurse shook her head severely and began to climb the stairs. On the second landing she opened a door and entered a low room lit by one small dirty window. There was a bed in one corner of the room, and a large table covered with crockery, sewing materials, papers, &c., stood in the middle. The walls were hung with bird-cages of every description, some wretched little wooden things, others nice large breeding-cages, and all occupied by birds, who were fluttering and singing and filling the room with noise. Several strings were stretched across the ceiling, from which damp garments were hung; and diving under these, nurse reached the fireplace, before which a small boy was sitting. He had not heard her enter because of the birds; but directly he saw her, he got up from the floor, and seizing various rags, threw them over the cages from which the loudest songs were trilling, and then pushed forward a chair and said: 'Sit down.' He was a boy of about seven, with a well-shaped head and clear pale complexion; on his face was a grave expression, as of one weighed down by weary experiences.

'He is very ill, nurse. Do you think he *can* live? He is to be my very own, if he does;' and he held up a wretched-looking canary he had been cuddling under his coat.

'It looks very ill, Jim. Has it caught cold?'

'I b'lieve so. He used to sing beautiful, better nor all the others put together, and now I think he'll die.'

'I hope not.—But you didn't send for me to see the canary, did you?'

'No, nurse.' The boy paused and covered up his bird. 'I want to go to the 'orspital.'

'I'm afraid, dear boy, they can't do anything for you there.'

'Oh yes, they can; they can do most anything. Do take me.'

'But, Jim, it would be a horrid operation, and you would have to stay in bed for weeks.'

'I don't care; I don't care for nuffin, so as to be like other boys. Now, I can't run, but I tumbles down, and they shouts after me everywhere: "There goes Little Bow-legs!"' The boy's voice quivered, and nurse looked distressed.

Just then the door opened, and a woman came in with a black bundle in her arms. 'Bless me, nurse, is that you? Sure you are good to that boy. I dunno what he would do without the books you lend him, for he can't play like other boys.'

'Is that work, Mrs Millan?—How are you getting on?'

The woman unpinned the black bundle and threw it on the bed. 'Flannel trousers, nurse. A nice job to do in a muck of a room like this. They birds sprinkle dirty water over everything.'

'Better than no work; and the birds paid the doctor's bill last year.'

'That's true too.—How's Betty Evans?'

'She is much better to-day.—About this boy

of yours, Mrs Millan; he says he wants to go to the hospital to see if they can straighten his legs. What do you wish?

'Wish! I wish I'd never married his father. He's got his father's legs, and he'll get his father's temper soon, I specs.'

'I don't know anything about his father; but I think Jim is the best and most intelligent boy of his age that I know.—Do you wish him to go to the hospital?'

'As he likes,' replied Mrs Millan carelessly. 'I don't believe nothing will make those legs straight. 'Taint as though it were an accident; it runs in the family.'

'If anything could be done, it would probably be by breaking the bones of both legs, and the boy would be in bed a month.—Could you lie quietly on your back for four weeks, Jim?'

'Yes, or a year, so as I should be like other boys.'

'If he's set on it, nurse, he'd better go, if you can give him a letter.'

'I will give him a letter,' said nurse, rising. She glanced round the crowded little room, and longed to put in a plea for more space and light; but experience had taught her it was useless. The Millans were very respectable; but the husband was an enthusiastic politician, and his spare time and cash were devoted to the cause of his particular creed. He also had legs so bowed as to be a hideous deformity, and perhaps this had helped to embitter the man's spirit. Poor Mrs Millan had a hard time of it often with this cantankerous husband of hers; and her speech had grown very sharp, her nature hard, through constant collision with the man she had married from love and pity. She had to work to keep the home together; and small room though that home consisted of, it was often difficult to pay the rent. So nurse made no complaint of the untidy close room, but wrapped her cloak around her, and nodding good-bye to Jim, went forth into the storm-driven streets again.

That very afternoon she applied to the matron of the District Nursing Society, and secured an out-patient's letter for Little Bow-legs. She scarcely thought the surgeons would attempt to straighten such crooked limbs; but the boy might become more content were he once persuaded that his burden was inevitable.

Mrs Millan took Jim to the hospital the next Saturday afternoon. They found many friends in the out-patients' waiting-hall, and Mrs Millan enjoyed a good gossip before Jim's turn came to enter the surgeon's room. At last the porter passed her in; and a nurse in a white cap and apron came forward and took the letter, and after glancing at it, stripped off Jim's shoes and stockings and set him on a chair before the surgeon. A few rapid questions were asked, and several of the students examined the legs.

'My boy, do you want your legs put straight?'

asked the surgeon at last.

'Yessir.'

'You are quite sure you are willing to bear some pain?'

'Yessir.'

'Give him a ticket for the children's ward, Smith.—Next case, nurse.'

Jim's heart failed him for a moment when he found himself in the long ward with so many

curious eyes fixed on him as he walked along in his ungainly manner. Every one seemed very busy; and a nurse whisked a screen round a crib and slipped Jim into bed in no time, and then dismissed his mother, telling her to come again the next afternoon. Jim pulled the clothes over his head and cried a little; but presently a baby girl in the next crib began crowing at him, and Jim played bo-peep with her through the bars. Gradually he gathered courage to look around. There were such lots of pictures and toys and flowers about in this large bright room, that Jim thought it must be like the fairy palace in the book Nurse Grant had lent him. Presently there came down the ward a tall woman in a dark dress, but wearing a soft white cap with long floating strings, and a dainty apron. She had the most beautiful face Jim had ever seen, and she was always smiling. There were some people who knew Sister Mona well who said that when she wasn't smiling her face was the saddest face on earth. But Jim never saw Sister without a smile; and because of the love and compassion which dwelt in her eyes, he always thought she looked like the photograph of the Christ which hung opposite his bed. The Sister stood beside his crib while she read his entrance ticket; then she had a look at the poor crooked legs. She talked cheerfully to Jim all the time, but seemed to understand, as no one else had done, what a grievous affliction is an ever-present deformity. However, the next day when Mrs Millan came, Sister took her into her own little room and asked her seriously to consider whether she desired her son to undergo an operation before she came to a final decision.

'Bless me, Sister, I brought him here for an operation. I certainly ain't a-going to take him out again. He gave me no peace till I brought him; now here he must stop till summat's done.'

Sister turned away and went to question Jim; but he only reiterated his mother's statements. His one wish was to be like other boys.

It was Tuesday afternoon when the celebrated surgeon, Mr Pell Taylor, came to make a thorough examination of Jim. He was followed by a crowd of students, to whom he pointed out the most remarkable features of the case. He bade them notice the absence of all signs of rickets; he commented on the strangeness of such a deformity being inherited; and he told them that the outside world would say osteotomy was a cruel operation, not to be undertaken merely for the cure of a deformity; yet it was at the express wish not only of the parent, but of the small patient himself, that he was about to perform that operation. And in conclusion he bade the dresser of the case make a cast of the legs as they then were, and told Sister to have Jim in the theatre the next day at three o'clock.

After all, poor Little Bow-legs was only a child, and was very frightened when the time for the operation drew near. But he knew nothing about it. He remembered waking up and feeling very sick, and his legs pained him, and he cried a great deal. Then he slept again; but when he woke, the pain was still there, and his head ached, and he cried again. Then Sister came and tried to soothe him, but he scarcely heeded her till she said: 'Look at your legs, Jim.'

He dried his eyes, and Sister threw off the bed-clothes—and there were two straight legs tightly bandaged up between thin wooden boards, and slung from an iron cradle. He gazed in amazement.

'That's right, dear; don't cry any more, for you are no longer Little Bow-legs.—Drink some milk, and go to sleep.'

For the next few days Jim was very quiet; his legs were rather painful, and he had to lie flat on his back always. Then gradually he got more cheerful than he had ever been in his life before; he chatted with the other children and played with the toys the nurses gave him, and whenever his bed was made, he gazed anxiously at those two straight legs in the wooden splints. Did they really belong to him? Should he ever stand upright on them and walk like other boys? Mrs Millan came constantly to see Jim, for she was a good mother as East-end mothers go. She was never cruel to the boy; she was even kind to him in her own way; but she never dreamed of petting or caressing him.

'How's my bird, mother?' Jim always asked.

'Oh, it's all right: ever so much better nor it was when you was always foolin' it about. I reckon you'd better sell it before next winter, though. You'd get five shillings for it easy.'

Jim had another plan in his mind, but he kept it secret for the present. At last, after many long days of patient waiting, came the anxious time when the splints were to be removed. The great surgeon himself was there to see the result of his skill; and oh! with what suspense Jim watched while bandage after bandage was unrolled and the bits of wood were taken away. He held his breath while Mr Pell Taylor ran his hand over the thin little legs and then lifted first one and then the other.

'Yes, that's all right, Mr Roberts. Wonderfully successful!—Where are those casts?'

Sister fetched the casts of the two little bow-legs out of a cupboard, and Mr Roberts put them side by side with the two straight limbs which Jim was eyeing so anxiously. Were they really his legs? He tried to move one, and it felt dreadfully heavy and queer, still it did move a little, and certainly the great surgeon seemed content.

'Splendid! splendid!' he exclaimed. 'We must have a cast of the legs as they are now, and keep both for comparison.—Put a plaster of Paris bandage on now; but before the boy goes out, be sure and take a cast.'

'Is it all right, Sister? Shall I be able to walk on them?' whispered Jim.

'Yes; it is quite right. You shall run races and win them, in a week or two.'

The next time Mrs Millan came, Jim told her the good news with a smile. The old grave expression was leaving his face, and he was always laughing now.

'I suppose you'll be home soon?' said his mother.

'I s'pose so.—Do you think father would give me a cage for my bird? I've got tenpence here the doctors and people have gave me.'

'Bless me, child, you can keep the bird where it is till you sell it.'

'But it's my very own bird, mother, and I

don't want to sell it. I want to give it to the doctor what made my legs straight.'

'You little stupid! he don't want a bird.'

'Please, bring it next time, mother, and let me try.'

Sister was rather dismayed when she found a canary in full song located at Jim's bedside; but when she learnt what was in the boy's mind, she was greatly pleased. A few days afterwards she came running down the ward; and none of the children had ever seen Sister run before, so they called out: 'Hi! Sister!'—'Golly! look at Sister running!' But Sister only smiled, and ran on till she reached Jim, who was sitting on a small chair with two crutches by his side. Sister seized the cage and put it in Jim's hand and whisked away the crutches. Just then Mr Pell Taylor entered the ward, followed by the usual crowd of students.

'Now Jim,' said Sister, 'walk to meet him and offer him the bird.'

Jim struggled to his legs and walked down the ward, firmly and uprightly, till he met the great surgeon. 'For you, sir,' said Jim, holding up the cage, 'cause you have cured my bandy legs.'

CANINE SMUGGLERS.

AMONG the many ingenious devices which have been resorted to from time to time for the purpose of evading the Custom-house duties levied upon certain articles, it may not be generally known that our canine friends in a neighbouring country have played no inconsiderable part, but have been largely used as aiders and abettors in the nefarious trade of smuggling, themselves being the carriers of contraband goods. Such has, however, been the case in the north of France; and the way in which the dog was trained for the work of smuggling, and rendered an efficient agent capable of being entrusted with the cargoes which he was expected to bear in safety over the frontiers, is not without interest.

The commodities which the dog conveyed were chiefly lace and cigars, both of these being light and portable; and these articles were actually carried to and fro between Belgium and France for a considerable time by means of these sagacious creatures. The method by which the dogs were rendered amenable to this kind of traffic, and by which certain of them in many cases became quite notorious from their skill in carrying it on, was as follows. The dog required for the service was a shaggy or long-coated one; and in addition to his own natural garment, an overcoat, consisting of the skin of another dog of larger dimensions, was provided, which was fitted on to his shoulders and reaching to his loins, was fastened under the belly, in which part the smuggled goods were closely packed. These false skins, moreover, were so well adjusted as almost to defy the closest scrutiny. Besides this disguise, these smuggling dogs had to submit to a special training before they were deemed efficient and qualified to enter upon the business required of them. For this purpose the master-smuggler, the owner of the dog, made an initiative journey under the guise of a merchant or peasant going to the frontier upon a visit to a relation in the Customs; and he

himself would travel thither either by cart or by rail, whilst his accomplice would lead the dog by a cord, through a more circuitous and less frequented road, to the same spot. The dog had previously been kept without food for at least twenty-four hours, and upon his arrival was welcomed by his master with many caresses and an ample supply of his favourite meat. After this satisfactory reception, he was confined, and again kept without eating for the space of two or three days. After that time he was released, and then, hungry and impatient, he would make for his former home with all speed, traversing the same route along which he had been previously brought. Men were appointed to watch for his coming and to waylay him with threatenings; and if he were found to deviate from the route mapped out for him, and along which he had been taken, as if for the purpose of making a short-cut across any lane he had to travel, the dog was at once assailed with blows from cudgels, stone-peltings, and occasionally, if he perversely persisted, a gun with blank cartridge was fired at him. These men who thus assaulted the dog were generally clothed in a manner which resembled the uniforms worn by the police and the officers of Customs; consequently, a wholesome terror was thus duly impressed on the animal's mind in regard to all men wearing any official dress, and such were assiduously avoided, whilst considerable caution was also inspired with a desire to keep himself concealed.

The dogs were also always sent forth in the twilight, so that they habitually made their journeys during the night. By these means strenuously carried out, a complete training was soon effected, through which the dog, when deemed fit to enter upon his smuggling career, was able, by his continual excursions to and fro beyond the frontiers with the valuable loads entrusted to him, to bring in an excellent income to the master engaged in this illegal trade.

It was not likely, however, that a system like this could long be unnoticed, when men who had hitherto been poor and needy, and who were known to have been hardly able to gain a miserable subsistence, became wealthy in an amazingly short space of time. This mode of smuggling was discovered; but still it kept its ground, owing to the cleverness of the experts which had been long engaged in it. At Mabuse, there was a dog which had acquired so great a renown that he was dubbed *le diable* by the authorities. A price was set upon him. He was white, so all white dogs were carefully watched; but this dog was white no longer; the colour of his coat was frequently changed, and his master dyed him black, brown, or light tan by turns. It was the sudden accession of riches to the owner of this dog, and his indiscreet display of them by building a large and handsome house, that had riveted the attention of the revenue authorities upon this man's movements in the first instance; but the dog was very skilful, and long evaded the emissaries of justice. Snares and ambuscades were laid for him. Many tales were told of the artful manner in which he avoided them. At one time he mingled with a flock of sheep right under the eyes of the commissary of police; at another time he trotted the whole distance under the very carriage which was conveying the officer of excise

who was on the lookout for him. But the poor fellow was run down at last. Being sore pressed, he endeavoured to cross the Scheldt by swimming, and might have succeeded even then in effecting his escape, had he not received previously a slight gunshot wound. As it was, he met his fate, and was drowned. Within the false skin of *le diable* was found packed rich lace to the value of fifty thousand francs!

THE MISTLETOE.

THE wind blows cold, and the sun is low,
And the sapphire sky has changed to gray;
But blithely, blithely over the snow
The children troop from the woodland way,
Laden with holly and evergreen,
And the mistletoe peeps out between.

From many a church tower far and wide
The bells ring out with their merry chimes,
Telling glad tidings of Christmas-tide:
And the old folks dream of bygone times;
But the lads—O the lads, they whisper low
As slyly they hang up the mistletoe.

Grandfather sits in his old armchair
Spreading cold hands to the cheerful blaze;
Dear grandmamma, in her kerchief fair,
Remembers Christmas in *her* young days;
But the maidens smile, and their soft cheeks glow
As they linger under the mistletoe.

With a wreath of laurel and ivy bound
On the ruffled curls of her linden hair,
Baby sits like an empress crowned
(Her only throne is a cushioned chair).
Ah! many a kiss is in store, I know,
For our small, sweet queen 'neath the mistletoe.

Open the purse and unbar the door;
Let the Christmas angels in to-night;
Hearts that remember the sad and poor
Are filled with joy, though the purse grows light:
The milk of kindness should freely flow
Under the holly and mistletoe.

Let anger, and envy, and strife all cease,
Old wounds be healed, and old wrongs set right:
We hail the birth of the Prince of Peace—
Shine into our hearts, O kindly Light,
That brotherly love may burn and glow
Under the holly and mistletoe!

E. MATHESON.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to ensure the safe return of ineligible papers.

SABLES AND STARCH.

THERE is a characteristic story told of Gambetta, the late popular French tribune, that in the early days of his reputation, on being invited to one of the evening receptions of Madame Adam, the brilliant editress of the *Nouvelle Revue*, he entered that lady's salon in a very free-and-easy morning dress, including—so the tale goes—a flannel shirt. Believing his newly introduced acquaintance to belong to the too familiar type of the 'blue-stocking,' he was not prepared for the elegant etiquette of Madame Adam's since famous receptions. The good breeding of the hostess was, however, shown by the tact with which she immediately paid such marked attention to the clever but socially inexperienced young lawyer, that he was soon placed at his ease amidst the surrounding crowd of white ties and swallow-tails. In later days, when M. Gambetta became one of the chief figures in Madame Adam's salon, he would often refer with amusement to the circumstances of his first appearance there. The incident is one which in certain respects has probably happened to most of us, though few lawyers attain the position of Gambetta, and all hostesses have not the kindly art of placing at their ease the delinquent, who is only too usually young, and hence an acute sufferer.

Unimportant as the error in etiquette may be, to some sensitive minds nothing is more painful than thus to find themselves in walking-dress at dinner among a company of persons attired in what Thackeray has felicitously referred to as the livery of 'sables and starch.' It requires, indeed, either an inordinate share of conceit, or a genuine and very enviable share of philosophy, to be able to feel comfortable under such circumstances. That this should be so, affords a striking proof of the force of those conventionalities which have grown up with the advance of civilisation. Nothing, in fact, is more singular than the subtle manner in which these simple forms of etiquette seem to be associated with certain of our moral convictions. The savage, though, strangely enough,

he dresses with most punctilious care for war or for any religious ceremony, feels no necessity for a special costume when taking his dinner, if any of his irregular meals can be said to merit such a title. He squats down before his food, and eats with the aid of fingers to which soap and water are unknown. He would regard as an affectation—if he did not regard it in the light of a religious ceremony—the preparation, slight though it be, made by what, socially speaking, may be regarded as the next step onward, the pale-faced backwoods settler, who, before sitting down to his dinner, will—only, however, if a woman be present—probably give his hair a touch-up with the brush he dips in the basin or pannikin in which he has rinsed off the more apparent soil of his daily labour.

Strangely enough—still continuing the train of recognised conventionalities—by the settler, indeed by many other equally respectable members of the community, the extreme care of the townsman in dressing for dinner, is, we know, regarded much as the backwoodsman's conduct is looked on by the barbarian, and he in his turn regards the barbarian as a mere savage. This connection with morals, which thus in different sections of society is associated with the minutiae of etiquette, offers a not uninteresting phase of the study of sociology. That the process of civilisation has invariably tended in the direction of complicating what may be termed the ritual of existence, is a mere truism, involving at the same time the much disputed question as to the distinction between luxuries and necessities. The luxuries of one stage of civilisation soon assume the position of necessities. In this very connection it has not impertinently been wondered how the ancients could possibly have existed without soda-water or tobacco; yet a surprisingly large number of very worthy persons continue to this day to live certainly without one at least of these so-called necessities. As the elevation in the standard of living—within which province may be included the luxury of dressing for dinner—has invariably been commenced by the few, the many have always resisted innova-

tions of this nature as evidences of gross affectation and attention to frivolous details, which is not the light in which such forms are regarded when once firmly established. It was one of the severest accusations of effeminacy brought by the frugal Venetians against the Byzantine spouse of one of their early Doges, that the foreign Dogaresa ate her food with a fork. How subtly our views on this very matter have undergone a change, it is needless to remind those who are aware of the social and domestic evolution—through various stages of non-existence and steel two-prongedness—of what the Irish to this day know as the split spoon, on the 'nice conduct' of which, even in these days of electroplate, there is a curious variance of opinion, not to mention manual skill.

It has been urged that the now almost universally established habit of daily 'tubbing' may, or rather has come to be regarded in a similar manner. In a not very distant past, such a minute attention to cleanliness, even in what are known by some as the highest families, was in no way enforced as a moral duty, as would seem to be the case nowadays. Something of the old traditions of defiant dirtiness may be said still to linger with a large number of the community. An occasional bath, as an American writer has put it, is even yet as much as is thought by many compatible with moral earnestness and high aims. Similarly, the habit, as a habit, of dressing for dinner is a disputed question in many families. By the more serious portion of those on whose personal exertions the general comfort of the household may be said to depend, the custom is usually considered as essentially an inconvenience, though of late years the observance has spread in circles where a generation ago such a concession to etiquette would have been regarded as eminently frivolous and affected. This fact of course may be attributed to the larger spread of formal social entertainment, as compared with the less exacting past. Apart from that small section of the community known as 'society,' which lives in a perpetual round of social exactions, and therefore wears 'sables and starch' as an evening uniform, there is a very considerable number of professional men who in the present day find themselves during 'the season' so constantly invited out that it becomes with them almost a necessity to assume the swallow-tail with the approach of night. The comfort alone of changing the clothes worn during the daytime is no small inducement to many others; while that all-powerful motor of 'respectability' steps in to encourage the habit with a large number of others. At the same time, it will be freely admitted, nothing is more troublesome than the absence in certain sections of our society of any fixed rule on the point, a feature only surpassed by the equal uncertainty which prevails respecting the hour of dinner, in discussing which, it is surprising how the latent snobbism of certain persons makes its appearance.

Entering on an entirely different matter—the origin of our existing evening dress, like many other social features, may be said to be lost in the mists of antiquity. Little as its cut and details have changed within the last thirty years, the swallow-tail coat almost in its present form will be found in fashion-prints of exactly a hundred years back, some two or three years prior to the

outbreak of the French Revolution, which, in addition to the political and social changes it produced, affected scarcely less radically the costume of the civilised world. Till the reign of George III., and in France till that of Louis XVI., the every-day coat worn by respectable society was of a type approaching what is now regarded as an overcoat, while the waistcoat was scarcely less conspicuous for its length. Some two or three years before the memorable date which marks the fall of the Bastille in 1789, we can trace the general form of our existing costume. This can be seen not only in the cut-away coats then worn, but in the boots worn instead of shoes, and the round hat, which was so shortly to sweep away for ever the long established cocked-hat; though, let it be remembered, the elder members of the community continued for many years to retain the fashions of the past, a fact not sufficiently realised by the stage costumier or the historic painter.

Any one desirous of passing an interesting hour or so could not do better than examine a collection of costume plates of the last hundred years. During that time, varied as have been the changes in the dress of our grandmothers and mothers, the male costume has undergone only very minor alterations. With the close of the last century, our modern dress may be said to have been definitely determined. With the simplicity of attire which was introduced by the French Revolution, were abolished for good, with wigs, powder, and red heels, the brilliant silks and satins and embroideries so affected by our great-grandfathers. Henceforth, a good suit of honest broadcloth became the universal evidence of respectability. With the earliest years of this century, the black swallow-tail coat, though worn in colour in walking-dress far into 'the thirties,' we find firmly established, and with that profusion of clean linen which has always been recognised as a mark of gentility, came to be regarded as the correct costume for evening wear in society, in the House of Commons being obligatory. In spite of the many efforts made to modify its forms and even its colour, that costume, with all its inconveniences, has been found by the civilised world to answer a definite purpose. It is clear that a long time will elapse before modern evening male attire will undergo any important alteration.

MR ESHOLT'S YOUNG WIFE.

A STORY IN TWELVE CHAPTERS.

CHAPTER X.

WILMOT was just leaving Mr Esholt's room with a number of letters and other documents in his hand, when a servant came to tell him that there was a gentleman at the door who desired particularly to speak with him. Wilmot went at once, thinking it was probably a messenger from Mr Kimber; but the person he found waiting in the entrance hall was a total stranger to him. He was an under-sized, dark-complexioned, dapper-looking man, apparently about thirty years old. He had keen bright-glancing eyes, an insinuating manner, and a soft sleeky voice. He wore a suit of mourning, new and very shiny, with two large jet studs

showing prominently on the ample bosom of his shirt. Wilnot bit his lip as he went forward, as if to keep down some inward agitation.

'You are Mr Wilnot Burrell, I presume?' said the stranger, seeming to take him in at a glance from head to foot.

'That is my name,' answered Wilnot stiffly.

'As I have called on a private matter of some importance, I had better, perhaps, begin by introducing myself,' went on the other, as he extracted a card from his case and presented it with a smile and a little bow. Wilnot took it, and read thereon a name he had never heard before: 'Mr Reginald Vampy.'

'You say you have called to see me on a private matter,' he said, his eyes wandering from the card to the stranger's face and then back again. He was evidently ill at ease about something.

'Precisely.—I see you are busy'—with a glance at the letters—'but five minutes will suffice for me to say all I have to say.'

After a moment's hesitation, Wilnot said: 'Come this way, Mr Vampy;' and with that he led the way towards the study. Mr Vampy followed with a remark or two as to the unsettled state of the weather, to which the other hardly responded. As soon as they were inside the room and the door shut, the little precautionary measure already described took place, after which the two men sat down at the table, facing each other.

To Agnes, hiding there in the dark against her will, the situation was one that filled her with dismay. There was no way out but through the study. Should she, or should she not, make her presence known? But how account for being there?—how explain why she did not come forward at the moment Wilnot drew back the *portière* and announce herself? But even while she was asking herself these questions, the two men began to speak, and she recognised that the moment for retreat had gone by. With her consent or without it, she must perforce stay where she was till the interview should come to an end.

'As your time is valuable, and mine, perhaps, scarcely less so,' began Mr Vampy, 'I will not waste it by beating about the bush. Brevity, as I take it, is not merely the soul of wit, but that of business as well. I have here in my possession'—and he produced a bulky pocket-book as he spoke—'a certain slip of paper bearing your signature on one side of it and that of Mr Robert Esholt on the other. It is, in fact, a bill, drawn at two months' date, for the sum of two hundred and fifty pounds, and will fall due a fortnight from to-day. In all probability, you recognise the document in question?' Mr Vampy held up a slip of paper between his thumb and finger as he spoke.

If Wilnot Burrell's face had been pale before, it was ashen now. His mouth worked with a strange nervous twitching. For a few moments all power of speech seemed taken from him. Mr Vampy put back the slip into his pocket-book and quietly waited.

At length Wilnot spoke. 'The bill you hold was given on the distinct understanding that it should be accepted as deposit, and not be discounted or allowed to change hands in any way.'

'That is a point respecting which I have no information,' replied Mr Vampy in his quiet precise way; 'but in business, circumstances sometimes alter cases, and as a matter of fact the bill has come into my people's hands in the ordinary course of such transactions.'

Again there was a brief silence. Wilnot seemed to be weighing every word in his mind before giving utterance to it. 'Even granting such to be the case, Mr Vampy—although, mind you, a gross breach of confidence must have been committed somewhere in order to make such a thing possible—the bill does not fall due for a fortnight, consequently—you will pardon my saying so—I fail in some degree to gather the purport of your call upon me this evening.'

A peculiar smile wrinkled the curves of Mr Vampy's mouth and peered out of the corners of his eyes. It was not a pleasant smile, and Wilnot's marrow seemed to turn to ice as he saw it.

'The reason of my visit, Mr Burrell, is not far to seek. My people have had some previous acquaintance with the signature of Mr Esholt, who, as you are doubtless aware, writes a very bold bluff sort of hand. Now, singular to say, our cashier—he is one of the most suspicious of mortals—is not altogether satisfied with the endorsement of the bill I showed you just now. He says that it differs in two or three small but very recognisable particulars from Mr Esholt's usual signature, and that when that gentleman wrote it, if write it he did, he must either have been ill or—shall we say—slightly "mellow," or, in fact, anything you please except in his ordinary business mood. Such being the state of the case, my firm have deputed me to wait upon you, or upon Mr Esholt, or both of you with the view of satisfying that most suspicious of cashiers that the endorsement in question is really that of the person it purports to be. I hope I have made myself clearly understood?'

Of a surety he had done that, as Wilnot acknowledged to himself with an inward shiver.

'Pray, Mr Vampy,' he contrived to say presently, 'may I inquire the name of the firm you so ably represent?'

'That is a detail, Mr Burrell, which at this stage of the affair I grieve to say I am not at liberty to enlighten you on. When I called at your Water Street office this afternoon,' he continued, 'and was informed that I should find you here, I was also told that Mr Esholt was ill. Possibly, however, he is not too ill to see me for half a minute, so as to enable me to satisfy my people with regard to the little matter which has brought me here. Perhaps, Mr Burrell, you will kindly ascertain whether Mr Esholt will favour me with an interview.' As he spoke he took out his watch and glanced at it.

Wilnot felt as nearly all hunted animals are said to feel when brought to bay. He could not turn and rend his foe, much as he would have liked to do so, but he could at least set him at defiance and dare him to do his worst. Like many other men, he was only a coward up to a certain point; and now that the worst had to be faced, now that no door of retreat seemed left open to him, his nerves braced themselves like bands of steel. Leaning forward, with his elbows on the table, and looking his visitor straight in

the eyes, he said in a cold hard voice that was not without a touch of defiance in it: 'What should you say, Mr Vampy, or whatever your name may be, if I were to tell you that the endorsement on that bill was *not* written by Mr Robert Esholt?'

'I should say that you would be telling me nothing more than I had a very strong suspicion of already.'

Wilmot sank back in his chair and stared at the other, as not knowing what to say next.

Mr Vampy's irritating smile once more crept over his face. 'I was pretty well assured before I entered this house,' he went on, 'that Mr Esholt's pen had never written his name on the back of the bill in my possession.'

'In that case, sir, may I ask once more to what I am indebted for the honour of this interview? I presume your only object in coming here was to inform Mr Esholt of your clever discovery; why, then, you should have sought this preliminary interview with me, I am at a loss to understand. Mr Esholt is up-stairs, and although far from well, I have no doubt he will see you on a matter which so closely concerns the interests of both of you. Shall I ring for a servant, Mr Vampy, to take up your card?' He half rose from his chair as he asked the last question.

'I admire your impetuosity, Mr Burrell,' answered the other in his sleek evenly modulated tones, 'although, under the circumstances, it is perhaps scarcely judicious on your part to give way to it. Apparently it has not suggested itself to you that in coming here I might possibly be actuated by a motive very different from the one you have imputed to me.'

A great throb of hope seemed to vibrate through every nerve in Wilmot's body; he half caught his breath for a moment; then he said in a faint voice: 'Go on, sir, if you please.'

'I presume, Mr Burrell, that when the little document to which our conversation refers was first launched on an unappreciative world, there was some likelihood of its being duly honoured when it should fall due?'

'Every likelihood, Mr Vampy—a likelihood which is as strong to-day as it was six weeks ago.'

'I am glad to hear it—very glad, for your sake, Mr Burrell. Supposing, in that case—I merely say *supposing*—our firm should see their way to allow the bill to come to maturity in their own hands and without negotiating it further, it may be accepted as a fact that it would be met in due course on its presentation on the twenty-fourth?'

'That may be accepted as an undoubted fact, Mr Vampy,' he replied, but with just a shade of hesitation, which did not escape the other's notice.

'That is to say, Mr Burrell, so far as one may accept anything as a fact in a world in which promissory notes play such an important part.' Mr Vampy chuckled softly to himself, and then resumed more soberly: 'So far, so good. Our firm, Mr Burrell, while actuated by every desire to conduct their business on purely philanthropic principles, find themselves under the unfortunate necessity of doing as their neighbours do. You will scarcely, therefore, be surprised at my asking you what return you would be prepared to make in consideration of the service just hinted at by me?'

Wilmot moistened his parched lips with his tongue. Then he said: 'Will you tell me what return it is in my power to make?'

'I will. The bill I hold is for the sum of two hundred and fifty pounds. You shall give me a supplementary document—merely your own note of hand—for a further sum of one hundred pounds, making in all three hundred and fifty, which amount you will be in a position to meet this day fortnight—eh?'

Wilmot Burrell set his teeth hard and clenched his hands. He was so utterly taken aback that he needed a few moments to recover himself. But the brain works nimbly in the great crises of our lives. 'If I am in a position to meet two hundred and fifty pounds on the twenty-fourth, I shall be in a position to meet another hundred,' he said to himself. 'Should I not be in a position to meet either, then one piece of paper will be just of as much or as little value as the other.'

Mr Vampy had picked up a book and was glancing over the title-page. Presently he said: 'Well, Mr Burrell, what say you? Do you accept our proposition?'

'I accept it.'

'Good. On the supposition that you might do so, I brought with me a little form duly drawn up, to which I will presently get you to affix your signature. Before doing so, however, I must ask you to be good enough to enlighten me as to the means you propose to adopt, or the source from which you propose deriving the funds to enable you to meet your engagements on the day in question.'

If Wilmot had been staggered before, he was doubly so now. He stared at the little man in black as if he only half comprehended his meaning. Mr Vampy looked at his watch for the second time.

'Pardon me,' said Wilmot at length, a little stiffly, 'but you are seeking to inquire into private matters which concern myself alone.'

'Pardon me, Mr Burrell, but is not our interview of a private and confidential nature throughout? When you come to think the matter over, you will recognise that I am asking of you nothing unreasonable. You have promised to meet a certain engagement by a certain date; all I want to know is the method by which you purpose arriving at the result in question. Without doubting your bona fides in the least, you will allow me to hint that there is nothing to hinder you between now and the twenty-fourth from starting for Paris, or New York, or Timbuktoo; in which case what, may I ask, would be the value of the little bill which my firm, wisely or unwisely, have taken upon themselves to discount?'

Wilmot abruptly pushed back his chair and began to pace the room like a man in a strait from which he sees no way of escape.

'Come, come, Mr Burrell,' said Mr Vampy in a tone of mild banter; 'there's not the slightest necessity for you to put yourself about. A little confidential information is all I ask for, which there can be no difficulty in your affording me. May I be allowed to hint that possibly there's a bit of horse-flesh at the bottom of your little difficulties—that perhaps you are looking forward—eh? to the Croxton Autumn Meeting, this

day week, to recoup your fortunes and set you on your legs again? Come, now, Mr Burrell, confide in me—make a clean breast of it.'

'You've hit the right nail on the head, Vampy!' exclaimed Wilnot in one of those sudden bursts of confidence to which desperate men sometimes give way. 'I've laid sixteen to one on *Persephone* for the Croxton Cup; and if she pulls it off, I shall be able to wipe the slate clean and have a clear thou. into the bargain.'

'Bravo, Mr Burrell, bravo! When a man takes to riding across country, he should ride boldly or not at all. I hope with all my heart *Persephone* will show the others a clean pair of heels—all the more because I happen to have a couple of fivers on her myself, so that you and I may be said to row in the same boat. Still, there are uncertainties in all things mundane, not excepting horse-racing, and I am sure you are far too astute an individual not to have at least two strings to your bow in the little game you are now playing. Supposing for a moment *Persephone* does not come in first—what then?'

The momentary elation which had shown itself in Wilnot's eyes a minute or two before had now died out again; his face put on the same dull ashen hue it had worn earlier in the interview. He had resumed his seat, and was nervously tearing a sheet of paper into minute shreds. After a moment or two he said, but without raising his eyes from the table: 'Even if that should happen which you say might happen—not that it will, mind you—I have other means left of meeting my engagements when they fall due.'

'And those means are?'—queried Vampy's silky voice.

There was no reply. The sheet of paper was still being torn and retorn. 'I am awaiting your answer, Mr Burrell. Time is on the wing, as some poet has very justly remarked.'

Wilnot drew in his breath and set his teeth hard for a moment; then he said, in slow sullen tones, still without looking up: 'We have a big settling-day at the office on the twenty-fourth.'

'I understand. The bill will be met by you out of the day's proceeds.'

Wilnot nodded.

'And after that— But that is a matter which concerns yourself alone. So long as my people can rely on having their money, they have nothing to do with anything further. As it happens, I have some acquaintance with the interior working of Mr Esholt's office; but I had no idea, Mr Burrell, that you held a position in it sufficiently onerous and confidential to allow of your being able to—well, to meet a liability like the one we have been discussing, without running the risk of any immediate unpleasant consequences to yourself.'

'The explanation is simple enough,' answered Wilnot, still sullenly, for at no time was he one to stand being catechised without resenting it. 'So long as Mr Esholt is away ill, Mr Kimber, the head-clerk and cashier, undertakes the general management of the business, while his own ordinary duties are divided between myself and another clerk.'

'Nothing could be clearer so far,' answered Mr Vampy blandly. 'But supposing—and we always have to suppose a great deal in these

matters—supposing Mr Esholt should be well enough to return to business earlier than the twenty-fourth, and Mr Kimber were to resume his ordinary functions—what then?'

No answer.

'It seems to me, Mr Burrell, that there is still a little screw loose somewhere—just a possibility, in fact, that your house of cards may come tumbling about your ears at the last moment. "The best-laid schemes of mice and men"—you know the rest. And in such a case, what would become of my poor little bill? Have you nothing further to suggest, Mr Burrell?'

'Nothing.' It was indeed a house of cards that he had built for himself; he recognised that fact now, in the pitiless light thrown on it by his visitor, as he had never had the courage to recognise it before.

'It seems to me,' said Mr Vampy, after a pause, during which he had been softly tapping on the table with the nails of his right hand, 'that there is one way, and one only, by means of which my people will be able to make themselves absolutely sure of their money, and you at the same time have one more chance afforded you of pulling yourself together and of running straight for the future.'

Wilnot looked up, and the eyes of the two men met. Wilnot's eyes asked the question his lips were powerless to ask.

As if in answer to it, Mr Vampy leaned forward a little way and said in low impressive tones: 'Mr Esholt must *not* be well enough to go back to business by the twenty-fourth.'

SHEEP-WASHING IN NEW ZEALAND.

THERE may be many who have seen sheep-washing as it is carried on in England, to whom a description of the manner in which large flocks are similarly dealt with in the colonies should prove interesting. If the reader will understand, first of all, that in the colonies forty thousand sheep are considered but an average flock, it will be seen that to wash such a number with hot water and soap, and to rinse them afterwards in running cold water, is no trifling undertaking. Washing is not deemed necessary on all 'stations' or 'sheep-runs'; and year by year there seems to be a growing inclination to abandon the work as costly and unprofitable. On different stations, too, the process adopted varies considerably, and in some cases it goes no further than a quick plunge through cold water only.

The object of this paper is to attempt to describe a particular 'dip' in the South Island of New Zealand, in which the writer took part during the spring (colonial—month of November) of 1881. The run in question lies upon the north bank of the Waitaki River, and the entire flock numbered some eighty thousand sheep, but rather less than half of these only were washed or 'dipped.' For this purpose, twenty-four men had to be employed, exclusive of the 'musterers.' These latter are the men who go out upon the run at shearing or washing time with trained dogs and gather together and drive in the sheep.

In mustering, the run is cleared in sections, and in many places it is very difficult and laborious work. This can be understood when it is realised that a sheep-run may contain one hundred thousand acres of land; and this land, it must be remembered, is very unlike any country upon which sheep are depastured in England. Mountainous and broken country much of it is, and often studded with clumps of thick timber. So rough and broken is most of the sheep-country in New Zealand, that mustering on horseback is quite impossible; hence the shepherds or musterers have to travel on foot; and climbing hills and fording mountain torrents and rivers, they gather the sheep together in flocks, with the aid of their dogs, and drive them in as best they may. The run will be divided, as already stated, into sections. These sections, ranging from five hundred to ten or fifteen hundred acres in extent, are termed 'paddocks.' The musterers then take the run paddock by paddock and gather in the sheep, and drive them to the shearing shed or dip, as the case may be; and it is their duty to keep the supply always up to the demand of the shearers or washers. To this end the mustering gang will be sent to bring in the sheep from the first paddock a day or two before the men who are to deal with them are engaged to begin work. Thenceforward the musterers have to work day and night might and main, that they may be always in readiness with fresh sheep as each batch is disposed of. In the old days, before the invention of wire fences, there was no subdivision of the runs into paddocks, and then the labour of mustering was far more troublesome and unsatisfactory. The number of permanent shepherds whom it was then necessary to employ was also much greater than is the case at the present day. Thus wire fences throughout the colonies are termed 'wire shepherds;' and many a broken-down old tramp may be heard to curse the invention of fencing-wire, which he avers has deprived him of the means of earning a livelihood.

But now let us suppose that the musterers have brought in their first mob of sheep and that the work of washing is about to begin. The necessary number of men has been engaged; and each man has had to sign an agreement for the wages he is to receive, binding himself to work under certain conditions. The sheep as they are brought in by the musterers are driven into a large fenced yard which opens into one somewhat smaller, this second yard opening again into one smaller still, and so on until they all culminate in a small pen capable of holding from forty-five to sixty sheep. The first dip-hand was the 'yarder-up,' whose duty it was to keep working the sheep forward as the final small pen and the yard leading into it were emptied. In this temper-trying labour he was assisted by a dog. Next, in the small final pen, two hands were stationed. These, for reasons following, were called the 'dry-chuckers-in.' Now,

one side of this pen consisted of a swinging shutter, a door, in fact, hinged upon its upper edge instead of on its side; and upon the outside of this door there was a sheer fall of about four feet plump into one end of a long wooden trough. This trough, about twenty feet long, two feet six inches wide at the top, and seven feet deep, was sunk in the ground to a depth of about six feet; it was filled twice daily with water heated to a certain temperature, and in which a liberal allowance of soap had been boiled up. For the heating and soap-mixing there was a furnace built under two large iron tanks; and the third dip-hand, an old soldier, had the responsibility of keeping up the supply of hot water and soap. A pipe led from the tanks to the trough, and the water in the latter was replenished as it decreased, owing to the quantity carried away in the wool of the sheep as they passed through it. The portion of the trough immediately under the swinging door was partitioned off from the rest by a little gate sliding in a groove, and fitted to lift up and down by hand in the same manner as a sluice-gate; and this end of the trough, and the side of it opposite to the swinging shutter to a distance equal to the length of the shutter, were built up to a height of five or six feet, so that the falling sheep should have no chance to escape. The remainder of the trough was similarly divided into four partitions, to the charge of each of which a man was appointed.

At the beginning of the day's work, the dry-chuckers-in, having received the 'office' from the overseer, opened the proceedings by grabbing each a couple of sheep and throwing them against the swinging shutter with force sufficient to carry them through, so that they fell souse into the water below. And inexpressibly astonished the animals used to look as they disappeared and the shutter closed after them. The berth of dry-chucker-in was one of some dignity, because upon these officers devolved the responsibility of keeping tally of the number of sheep washed. The writer, in company with a diminutive but muscular Jew, had the honour of this appointment, and kept the score, as aforesaid, with a sense of vast importance. Four sheep having passed through the shutter-way much as the clown in the pantomime makes his exits and entrances, it was the duty of the man stationed at the first division of the trough to take them in hand. This he did by first ducking the heads of any of them that might have managed to escape total immersion in the fall; after which he rubbed the soapy water well into them, particularly round their necks, with a weapon designated a 'crutch.' This was an instrument precisely in the form of the ordinary crutch used by lame people and of about the same size and length. But the sheep-washer reverses arms, as one might say, and performs the rubbing with the crook-end. The crook also serves to hold up the chins of any sheep which may come near drowning in their progress through the bath. Having rubbed them down all round, this first man lifts the first little gate and

with his crutch passes the four sheep into the next partition. Then, immediately the gate is shut again, the dry-chuckers-in—always on the alert—hurl down other four sheep; and thus the trough is kept always full from end to end with the sheep passing through it in a continuous string; the man at each partition repeating the process of 'crutching' already described. Each man is engaged upon his batch of four sheep just long enough to give them about half-a-dozen brisk rubs apiece. From this it will be seen that neither the dry-chuckers-in nor any of those engaged in the work have much idle time.

Reaching the end of the hot-water trough sneezing and gasping, and with their thick wool so loaded with soapy water that their legs can scarcely sustain their own weight, the poor sheep are pushed, dragged, and goaded up an inclined plane into another small pen elevated to the level of the dry-chuckers'-in pen. Here they fall into the hands of the wet-chuckers-in, three in number. This, the wet pen, has upon one side of it the approach from the hot-water trough already described, and upon each of the other three sides a swinging door, as in the dry pen, but smaller. The door in the dry pen is the full width of the side; but those in the wet pen close the orifice of a shoot only just wide enough to allow a sheep to slide down it end on. Beneath each of these shoots there is a well about eight feet long by four feet wide and some five feet deep. These wells are in fact boxes let in flush with the ground in the same way as the hot-water trough. Upon three sides the walls of the wells are perpendicular; but on the fourth and outer side there is a sloping part equivalent to the inclined plane which leads out of the trough into the wet pen. This serves for a landing for the sheep when their cleansing is perfected.

But they are not half done with yet. Emptying into each well there are two spouts of water falling from a 'fluming' overhead. These spouts are each about the length of a sheep, and are fitted one near each end of the well and parallel with the end or shorter side of it. The water falls from the fluming overhead some four or five feet to the bottom of the spout, and the orifice through which it then passes being very narrow, the stream of water disgorged falls with considerable force. Near each corner of the well and in the same line with the spouts, a barrel is sunk flush with the ground—that is to say, there are two barrels to each spout, one at each end, and in the same line with it. In each barrel a man stands sunk nearly to his armpits, so that he is able conveniently to lean forward over the well. Thus there are four men to each well, or two to each spout. Now it is the business of the wet-chuckers-in to keep the men at the wells supplied with sheep just as the dry-chuckers-in feed the men at the trough. But the berth of the wet-chucker-in is certainly no sinecure, whatever that of his dry confrère may be. The wet sheep are heavy, frightened, and stubborn, and often so exhausted that they have to be hauled laboriously out of the hot-water trough by the 'scruff of the neck.' An average colonial sheep will weigh, I think, about fifty-six pounds when fully fleeced. He is also springy and active; and any ordinary man, with a preliminary pressure downwards upon the animal's back, and then a quick

lift, can throw it easily over his head. But when the animal is loaded outside, and half-filled inside, with soapy water, he is a very different handful. However, they have to be got out of the hot-water trough somehow; and when they have been safely landed in the wet pen, they are sent two by two down the shoots into the wells beneath. Each shoot has at the bottom a second swinging door weighted with lead, to break the fall of the now heavy and helpless animal. The shoots disgorge the sheep in the middle of the well between the two spouts; and when it plumps into the water, the two spouters, who are ready for it, take each one end and drag it beneath their spout. Upon the bottom of the well, underneath each spout, two rollers are fixed, which rise high enough to give a rest for the sheep while being spouted. The wet-chuckers-in, from their pulpit-like pen above, can see when either pair of spouters has finished a sheep, and their duty is to keep the supply up to the demand. Each spouter is professedly provided with a complete waterproof suit—sou'-wester, gum-boots, and oilskin coat—to protect him from the splashings made by the struggling sheep, and from the leakage that falls from the fluming above. But to the considerable discredit of the station owners, the efficiency of the waterproofings was largely a thing of the past.

When the spouters have placed a sheep in position under the spout, and resting on the rollers as described, they hold each two legs with one hand, while with the other they turn the animal slowly from side to side, at the same time parting the wool, so that the water may have free access to the skin. The continuance of this treatment for a minute or two brings about a magic transformation in the appearance of the sheep. By the force of the water the dirt is knocked rather than washed out of the wool, and in a very short time the animal is turned off the rollers and guided to the landing-place a new being. Having landed from the well, it is at liberty to wander off unmolested into a fresh grassy paddock. From this sanctuary, at the end of a couple of days, when the fleece is dry, the sheep is taken to the shearing-shed and disrobed.

A few words now as to the pay earned by the men engaged in the work. All the men except the spouters were paid 'twenty-five shillings a week and their tucker;' that is to say, they were provided with a hut to sleep in, rations and a cook, and the twenty-five shillings a week. The payment is always made upon the conclusion of the work by bank cheque; and then begins the stampede for the nearest public-house. The spouters were paid thirty shillings a week and tucker; and well they earned the extra pay. Spouting is not pleasant work, whatever dry-chucking-in may be. The water that falls through the spouts is intensely cold. This is the case with all running water in New Zealand, because nearly all the rivers rise in snow-clad mountains, from which they run with such impetuous rapidity to the sea, owing to the steepness of the descent, that there is no time for the warmth of the sun to raise the temperature materially even at midsummer. If the spouter be a raw hand or unskilful in the work, he will be splashed over the head and face all day until he is nearly blinded, and the water will trickle down his neck, inside the waterproof coat, and

wet him from head to foot. Let him be ever so handy, he cannot escape a semi-drenching daily from the leakage of the fluming above his head. For the sake of seeing all the fun while he had the chance, the writer relieved a rheumatic spouter for one day; but he felt no ambition whatever to prolong the experience. The day chancing to be bitterly cold, considerably enhanced the enjoyment—and his awkwardness in handling his sheep led to a pretty equal division of the spouting between himself and the quadruped. He came out of his tub at night more dead than alive, and with the colours of a blue-and-white flannel shirt transferred to his skin, so that he looked like some new species of aboriginal warrior. Diogenes found philosophy possible with his days and nights spent in a tub, but eight hours in a sheep-washer's tub might have disturbed even his equanimity.

The working hours were eight daily. Beginning at eight o'clock in the morning, the work went steadily on until ten; here there was a rest for ten minutes, called 'smoke-oh,' when all hands went up to the hut for a pannikin of coffee and a piece of bread or plain cake; then back again to the pens, crutches, and tubs until twelve. Here there was a spell till one o'clock for dinner; then at it again till three, and another ten minutes 'smoke-oh' with coffee as before; after this the work went straight on until about twenty minutes past five—the odd twenty minutes patching up the breach made in the eight hours by the two 'smoke-ohs.' The coffee twice a day is an institution really devised for the sole benefit of the spouters, to whom some stimulant is almost necessary. All the spouters of old standing may be heard constantly bewailing the degeneracy of the times, which has brought about the unsatisfactory substitution of coffee for rum. In the 'good old days,' a 'go' or 'tot' or 'stiff nip' of rum was served to the spouters each 'smoke-oh.' The work lasted twenty-nine working days, during which time 36,471 sheep were washed—giving an average of over 1250 sheep for each day.

The sheep have to be turned out by the spouters to the satisfaction of the overseer, and on cold days the dirt is not 'knocked out' of the wool so speedily as in warm weather. This is because in cold weather the grease or 'yolk' in the wool congeals, and consequently, with the dirt that it holds, is less 'lively' and more difficult to loosen. Upon some days, great difficulty would be found in getting the sheep clean enough to pass the overseer, and none of them when finished would look anything like so well as upon other days. On hot days, therefore, they would be turned out much faster than when the weather was cold. Sometimes, too, the musterers would keep us waiting an hour or two for sheep. Running in such wild country, the sheep get their fleeces full of dirt and rubbish of every description, grass seed, coarse sand, bits of stick and bark, and notably thistle thorns. With these last, dry, every sheep's fleece will be loaded, as will every finger and most of the rest of the carcase of the dry-chucker-in, before the first day's work is done. For the first few days the yolk of the wool irritates the skin of the hands, and makes them so sore that clutching the sheep is torture to the tender flesh; and the harassed chucker-in will be seen trying to do the work with his knees, to avoid touching the wool with his hands at all. This irritation soon wears off;

and by-and-by, one falls into a knack of catching his sheep unawares and dexterously by one hind-leg and jerking him so quickly through the door that he has no time to struggle. Next, the dry-chuckers-in will vie with one another in feats of strength, selecting heavy sheep and pitching them over instead of through the door. There is an additional charm in this, because thereby the first crutcher below is made very angry. He gets splashed from head to foot, and probably varies the monotony of the day two or three times by dropping his crutch and storming the dry-pen fortress, bent upon punching the heads of his tormentors. It has not been demonstrated that this exercise is good for the sheep; and indeed it looks like the very refinement of cruelty. The wretched creatures are frightened and knocked about and tortured enough in the process without their misery being added to in this way. But it is only a question of whether being lifted over a door instead of thrown through it frightens them more; for, excepting accidents, neither method hurts them; they fall clear into the water. The greatest suffering falls to those with horns; many of these get knocked off, whereby the poor sheep must suffer considerable pain. Now and then a sheep with two and even three fleeces will be brought in—that is, a sheep that has escaped the musterers for a year or two, and so remained unshorn. These sheep become as strong and active as goats, and very wild and unmanageable. Sometimes, after having been driven with difficulty to the dry pen, they will jump the fence and make off again to the hills, escaping washing and shearing for another year.

The work of the 'yarder-up' is simply abominable. Yarding-up sheep is work fit only for stoics, and these do not abound among working-men. The frightful ill-treatment to which sheep are subjected when being yarded-up is pitiable to witness. But when a man finds that his inability to persuade a few sheep to run through a gateway is keeping twenty men or more idle, and is bringing down upon himself the wrath of 'the boss,' he is apt to lose his temper and forget to be pitiful.

MR MAGSDALE'S COURTSHIP.

IN FOUR CHAPTERS.

CHAPTER III.—DEEPER, AND DEEPER STILL.

MR MAGSDALE'S conference with his cousin brought him little comfort. Allan admitted that when he recommended a private marriage he had quite overlooked the possibility of Miss Cressburn raising objections; but since she insisted on following the conventional usage of the nineteenth century, he did not see that Peter had any right to oppose her.—What would Allan advise him to do, then?—It appeared to him that no advice was called for; Peter must take his intended down to Astley Villa and introduce her to Mrs Bunshaw, and the sooner he did it the better.—Could Allan help him at all in it?—Certainly not. This wasn't a case for the intervention of an uninterested party; he had done quite as much as he could to help him already, and Peter was quite able to fight his own battles; at anyrate, if he

wasn't, he ought to be.—After that, our friend understood that he need not look to his cousin for assistance, and went sorrowfully back to his office.

A very despondent miserable Peter crept down to Putney that evening. He felt that every one was against him, that there was nobody to sympathise or help, now that Allan had washed his hands of the business. He was aggrieved at his cousin's defection; he had aided and encouraged him so long as the path of his love ran smoothly, but the moment difficulty arose, he drew back, and bade him find his way through it by himself. It is to be feared that Peter's love was of that delicate hothouse growth which is incapable of withstanding rough treatment; which requires such gentle nurturing that it is not worth bringing to life, and does not deserve its name. His too tender passion was overshadowed, almost blighted, by the selfish fears which filled his heart. He had no ardent longing to see Mary Cressburn now; the knowledge that he must fulfil the promise he had made and face the consequences, hung over him so heavily that he dreaded meeting her. He had allowed three days to slip by since he received her answer to the letter wherein he promised to take her to see his relations, and was no nearer making up his mind to do it on the third day than on the first. He had a sneaking hope that she might relent if he waited long enough, and beg him to marry her how and when he willed. But time went on, and she made no sign; indeed, if she had consented to a secret marriage now, it is doubtful whether Peter's weak-knee'd devotion would have been equal to the test.

Allan had given sound advice when he recommended his cousin to lose no time in making Mrs Bunshaw acquainted with Mary Cressburn, though he knew nothing of the former's scheme regarding Miss Terripeg. Peter never lacked opportunities of going to Queen's Road now, had he cared to make use of them; he found his sister's friend at Astley Villa so frequently that her absence was more noticeable than her presence. She came early and stayed late, and worked perseveringly to establish herself in his good graces. She studied his peculiarities and tastes with an unobtrusive diligence which he gradually and insensibly grew to appreciate; she sought his advice, and listened to his opinions with a deferential respect for his superior wisdom which could not fail to impress a weak vain man with an idea of her good sense. It was not long before he overcame the old antipathy, which owed its origin more to Mrs Bunshaw's injudicious management than to any personal attributes of the lady herself; and without being absolutely disloyal to his fiancée, he formed a closer friendship than Miss Cressburn would have been at all likely to approve of, or, indeed, was entirely safe for so weak a vessel to indulge in.

Days lengthened into weeks, and Peter saw himself drifting slowly but surely into an entanglement which he had not the strength to avoid. A month passed, and Mary Cressburn had never called upon him to make good his word, though once she wrote, somewhat coldly, asking when he intended to visit her again. It roused the uneasiness he had tried to quell, and at the same time convinced him that he might trust to her affection

to obtain his own terms with her. She wanted him back, and he would go when she offered to set him free from the promise he had made. Her love for him was growing keener and brighter with starvation; and his, though he hardly knew it himself, was growing weaker and colder day by day. It was easy to leave her letter unanswered. She would understand that the promise she had extorted from him was the reason of his silence, and would know how to recall him if she wished; so Mary received no reply to her letter, and he went unhindered on his dangerous way.

It chanced one evening that Allan Magsdale, finding time hang heavily on his hands, made an excursion down to Queen's Road to see Miss Parkins and her niece. He had neither heard nor seen anything of his cousin since the day he had appealed to him for advice, and had a little curiosity to know how the affair with Miss Cressburn was progressing. Something more than curiosity prompted his visit: he had been the means of making Peter known to the young lady, and, when his attentions to her became obvious, had satisfied Miss Parkins of his ability to marry, in a pecuniary sense. He had, as we have already remarked, done much to bring them together, and felt himself in a measure responsible for Peter's good faith. He found the ladies at home, and met with the cordial reception they had always given him; but when he asked about his cousin, his question was received in silence, whilst aunt and niece exchanged glances as though they expected this and did not care to touch upon the subject.

'We have not seen Mr Magsdale for over a month,' said Miss Parkins with stiff formality, after an awkward pause.

'Of course Mr Magsdale may have been ill,' added Mary in excusing tones. 'I wrote to him a fortnight ago; but he did not answer.'

'We have not heard of Mr Magsdale for over a month,' said Miss Parkins as gravely as before.

'I haven't heard from him myself for a long time,' said Allan, who was anxious to defend his cousin, though an angry suspicion was raising its head, despite his efforts to persuade himself that nothing was wrong. Mary rose and left the room, murmuring some apology; and he was satisfied that she believed Peter to have broken faith with her.

'Do you know what has caused this?' he asked, as soon as he was alone with Miss Parkins.

The old lady laid down her work, and delivered herself of the feelings which had been pent up in her breast, unrelieved by speech even to her niece. She spoke calmly, but with an undertone of irritation. 'The last time Mr Magsdale came here I saw him alone, for something had occurred to make me think that he was not behaving honestly. I told him then that we didn't want to see him again until he was prepared to introduce Mary to his family, as she wished. The next day she told me that he had written promising to do it, and that she had asked him to call and arrange a day. Neither of us has heard a word about him since, and it's my belief that if we leave him alone, we never shall. He is a villain, that man! Mary says she has done with him for good and all; but I haven't.' The emphasis and energy of Miss Parkins' last words told Allan that she was in earnest, and that trouble in one

shape or another was in store for Peter. He asked no more questions; he was disgusted with his cousin's cowardly folly, and felt that he would richly deserve the worst fate it could bring upon him.

'I would never have believed this of him, had I not heard it from you,' he said. 'I will go down to Astley Villa to-morrow and find out what it means, if you think that I could do any good.'

'I don't think you could help us in that way, Mr Allan, thank you. I think, too, that I can settle accounts with Mr Magsdale myself, though I must do it without saying a word to Mary.'

Allan had no doubt of her ability to deal with Peter, and was relieved to find that his own connection with the affair did not saddle him with the task of giving assistance in bringing his kinsman to book.

Miss Parkins was a woman possessing much fixity of purpose; and the day after her conversation with Allan, she resolved to take the business in hand at once; she said nothing to Mary, being quite aware that she would strongly resent any step being taken which might lead Peter to suppose that he still held a place in her thoughts. Miss Parkins' plan of action was rather undefined: she meant to call at Astley Villa, and show the false lover up in his true colours before the circle of haughty relatives which his references to the 'family' led her to suppose she would find there. What such exposure might lead to, she did not know; but circumstances would have to guide her thereafter. Accordingly, she started on her mission the same afternoon, and reached the house at an hour when Peter was busy at his desk in Somerset House.

Was Mr Magsdale at home?—No; Mr Magsdale was not; but Mrs Bunshaw was in, if the lady would like to see her. Miss Parkins hesitated for a moment: the name of Bunshaw was a household word not only in the region of Putney but for a radius of fully half a mile round, and was not entirely new to her, though she could not at once recollect how it sounded familiar. Ah! of course, Cornelia Bunshaw, the champion of woman's rights. She had no idea what relationship the lady might bear towards Peter Magsdale, but clearly she was some near connection.—Yes, she would see Mrs Bunshaw, please; and she was conducted into that celebrity's 'study,' where she waited until the owner appeared.

'Miss Parkins, I am informed,' said Cornelia in her grandest manner as she entered the room. She had a good memory for names and faces, and at once recognised in her visitor the lady whom she had seen with her brother and cousin in the street some weeks previously, and whose niece she had been led to understand was the 'attraction' which drew Allan to Queen's Road on that Sunday. She sat down, wondering what could have brought the young lady's aunt to Astley Villa to see her.

Miss Parkins was a little at a loss to know how she had best approach the object of her visit, but, after a preliminary cough, she rushed into it with startling straightforwardness. 'I came to ask for an explanation of Mr Magsdale's conduct towards my niece, Miss Mary Cressburn,' she said, and stopped.

Cornelia, like the clever woman she was, saw it all quite plainly before she heard another word.

Allan had been 'amusing himself' with Miss Cressburn, and had gone off in a hurry when he found that he had carried it too far. His answer, when she expressed her regret at his departure, and the way he had spoken of the friends he had taken Peter to see, flashed across her mind. Of course, it was just what a harebrained fellow like Allan would do, to love and ride away as soon as he saw he was getting into trouble.

'You refer to my cousin, who resided here until four or five weeks ago,' she answered. 'He is not with us now, and I am not acquainted with his whereabouts.'

It was just about five weeks since Peter's last visit to Queen's Road; and Miss Parkins, who was quite ignorant of that perfidious individual's affinity to the lady before her, naturally accepted the information. It upset her calculations; she could not expect much from Mrs Bunshaw the cousin. But Mrs Bunshaw the advocate for the rights of women was the very best person whose sympathies she could enlist. She was a rapid thinker, and changed her ground with considerable skill.

'I am sorry to learn that he is nearly related to one so universally known and respected as yourself, Mrs Bunshaw' (Cornelia gave a cast-iron smile of acknowledgment); 'but now I have troubled you thus far, I am tempted to ask for your advice.'

Mrs Bunshaw's grim visage relaxed. Every one likes to be asked for advice, and she loved it. Advice about dealing with Allan's misconduct, too; it was most gratifying, and she grew quite gracious.

'I shall be happy to afford you any assistance, Miss Parkins, even though a relative of my own should be the offender. The claims of consanguinity must ever bow to Principle.' It was a high-minded sentiment, and Cornelia felt that she was doing herself justice.

'You encourage me to proceed, madam,' said Miss Parkins, a little overawed. 'About six months ago, Mr Magsdale was introduced to my niece; he paid continual visits, and their intimacy resulted in his making Mary a definite offer of marriage, which she accepted. Soon afterwards, he proposed to marry her secretly; but Mary of course wouldn't hear of it; and since she refused to do so, we have heard nothing more of him.'

'Did he assign no reason for wishing to keep his marriage private?'

'He said he feared opposition from his relations. I must add that he promised to present my niece to them, but never made any attempt to keep his word.'

'And you have heard nothing of him now, for a month?'

'Nothing whatever, Mrs Bunshaw.'

'I deeply regret to confess that such behaviour is quite in accordance with the estimate I have formed of my cousin's character.—But what do you propose to do?'

'I had intended to make his conduct known to his relatives, first of all.'

'He has none, except my brother and myself.'

'Then, I fear we can do nothing,' said Miss Parkins with a sigh.

'You have not considered the propriety of using the weapons offered by the law?'

Miss Parkins had never thought of taking such extreme measures: Mary Cressburn would be

furious if she dared to hint at an action for breach of promise of marriage, and publicity would be quite as objectionable to herself.

'My niece would never consent to the course you propose,' she said; 'we must allow the matter to drop.'

'Your niece's duty towards her sex should be her first thought, Miss Parkins,' said Mrs Bunshaw sententiously; 'but I see no necessity for letting her know what we do. I can vouch for it that Mr Magsdale will never face an action.'

'Mary would never forgive me if I made use of her name, as I should of course have to do; and even if he paid damages under threat of legal proceedings, she would not look at a penny of it. I'm afraid it isn't to be thought of.'

But Mrs Bunshaw was not so easily foiled. Allen appeared to have behaved disgracefully, and she was not unwilling to help to punish him. She thought for a minute before she spoke again. 'Is your niece of age, Miss Parkins?'

'Not yet, Mrs Bunshaw.'

'Then the duty of securing justice for her, the onus of protecting her from such designing knaves, devolves upon you, whether she approves of your methods or not.'

Miss Parkins wavered. Mrs Bunshaw, who must know the man intimately, was certain he would not face the ordeal of a trial. She thirsted to avenge her niece, and if she could do so by the simple expedient of a lawyer's letter, she might perhaps venture upon that, unknown to Mary Cressburn. She was not influenced by any hope of obtaining compensation; her aims were purely retributive; if she could succeed in making Mr Magsdale suffer for his faithlessness, she would be quite content. The only feasible means of punishment were those suggested by Mrs Bunshaw, and she began to give way.

'Even if I wished to go to law, I could not afford the expense,' she said.

Mrs Bunshaw rose from her chair, and striking the impressive attitude which was the admiration of the Society, permitted herself the luxury of a short and eloquent speech. We will not inflict the whole of it upon the reader; the last few sentences of the glowing peroration will suffice for our story: 'As I have explained,' concluded Cornelia, 'the fundamental principle of this organisation is the protection of our Rights. Your niece's Rights have been tampered with, grossly infringed, by a man whose kinship to myself I blush to remember. I would that our Work were sufficiently advanced to enable us to deal with him without having recourse to the uncertain remedy prescribed by the law. But I see no choice; and it will be the pride and the privilege of the Putney branch of the Society to extend to you the support and assistance you need.' Mrs Bunshaw looked round at an imaginary audience, and slowly sat down; whilst Miss Parkins watched her, indulging in curious speculations as to what the 'Society' would do to Mr Magsdale if he were handed over to it for treatment.

'I will give you a letter of introduction to Messrs Carrel and Stalker of Lincoln's Inn,' continued the champion, '(they are the solicitors we always employ), and direct them to look to me for liquidation of their charges, though they will of course ultimately fall upon Mr Magsdale.'

The idea of doing everything at the faithless man's expense had its effect upon Miss Parkins. She thought for a few moments, and finally declared her readiness to act upon Mrs Bunshaw's advice.

That excellent woman lost no more time in discussing the matter; she opened her writing-case, and proceeded to frame the letter to her lawyers, which she handed across the table to Miss Parkins for perusal. 'I have not mentioned any names but your own, you will observe,' she said; 'you are best able to explain the circumstances to Mr Stalker, who is the partner you will probably see.'

Miss Parkins, having read and approved the letter, took her departure, promising to let Mrs Bunshaw know at the earliest possible moment what result the step about to be taken might produce.

Miss Parkins returned to Queen's Road with the letter to Messrs Carrel and Stalker in her pocket. She intended to act upon Mrs Bunshaw's directions and see the solicitors the very next day. Peter appeared to have left Astley Villa more than a month ago—slinking out of the way, no doubt; but a letter addressed to Somerset House would reach his hands.

Although our unworthy hero allowed himself to drift perilously near the rocks, he awakened to a sense of his position in time, and finding himself unable to tack, decided to cast anchor. Miss Terripeg 'went down to see Mrs Bunshaw' nearly every day, on the tiptoe of expectation, and came away each evening lost in wonderment at this bashful lover's unaccountable slowness in speaking the words which she was certain trembled hourly upon his lips. Mrs Bunshaw, however, was confident that 'it was all right.' Peter was shy, Peter was diffident; he must not be frightened or hurried; only leave him alone for a few days, and she was much mistaken if that did not bring his addresses to the satisfactory climax Miss Terripeg had reason to expect.

But days succeeded days, and yet he did not speak. Mrs Bunshaw was growing angry and impatient; Miss Terripeg, who was depressed and inclined to be lachrymose, told her friend she feared that Peter was a deceiver.

'Try a little coldness for a day or two,' said Mrs Bunshaw.

So Miss Terripeg tried a little coldness at first, and then a great deal; she may be said to have iced her manner towards Peter before she gave up the plan. But it did not answer; he continued distantly polite and obstinately silent. The frigid course of treatment had been abandoned as fruitless the day before Miss Parkins made her visit to Astley Villa. Mrs Bunshaw at first conceived the idea of holding up Allan's scrape as an awful warning to her brother; but she gave it up, thinking that his friendship might prompt him to caution his cousin, and perhaps enable him to escape. It was too good a text for a lecture to be lost entirely, and accordingly she treated Peter and Miss Terripeg to 'a few remarks' that evening at dinner. 'I had a very sad case brought to me to-day,' she began, as though Allan were a species of moral invalid—'a very painful case, involving necessity for the Society to give assistance through its lawyers.'

Miss Terripeg was keenly interested at once;

how wise it was of the person to come straight to Mrs Bunshaw !

'It was a melancholy instance of the deep duplicity sometimes evinced by young men of the present day. A man had proposed to a girl, and ran away as soon as she accepted him.'

There was a crisp simplicity about the story which moved Miss Terripeg profoundly, and caused Peter to blush almost purple—no doubt at the awful duplicity of his own sex.

'The young lady's guardian called upon me, and I gave her what little advice I could on behalf of the Society. I cannot tell you the intense indignation with which I listened to this tale of heartless desertion. Were a relative of mine thus to disgrace himself' (she fixed the quivering Peter with an eye), 'I should die for very shame.' Mrs Bunshaw had almost said 'alter my will' before she succumbed to the painful ordeal referred to, but thought that might look too pointed, for Peter had not done anything depraved so far.

'How shocking!' cried Miss Terripeg.

'Dreadful!' added Peter, in a cold perspiration. Suppose Cornelia came to hear of Miss Cressburn and his proposal to her! He shivered.

'To encourage hopes you do not mean to fulfil, Peter, is a crime but one degree less profligate than desertion,' said Mrs Bunshaw meaningly to him afterwards, when Miss Terripeg had gone home; 'but I know that you would never be guilty of such conduct.'

Peter did not reply; he went up-stairs and sought refuge from his troubles in bed, where he dreamed that Cornelia made him deliver a speech to the Society advocating the infliction of capital punishment upon lovers who prove untrue.

'PAUL'S WALK.'

WE find in the literature of the earlier part of the seventeenth century constant allusions to St Paul's Cathedral under the abbreviated title of Paul's, or as it was then commonly spelt, 'Powle's.' These allusions seldom refer to the sacred or ecclesiastical character of the building; they are for the most part in connection with the everyday affairs of secular business or pleasure. Indeed, it is clearly evident that business of every possible description was regularly carried on in 'Powle's Walk,' as the nave and aisles of the great cathedral were called, not even excluding the somewhat scandalous traffic in church livings and benefices. There is a well-known passage of Dryden in his *Character of a Good Parson* which says of the subject of the poem:

Nor rode himself to Paul's, that public fair,
To chaffer for preferment with his gold,
Where bishoprics and sinecures are sold.

Paul's Walk was a general exchange for business men, and a public resort for idlers whether fashionable or the reverse. Even the font itself was impressed into the service of business, and appears to have been used as a kind of counter or telling-table. This appears in the writings of another author, who, referring to a loan or a proposed loan, says: 'I should ere this hour have seen a good piece of money told here upon

the font.' St Paul's was also the common resort of people seeking employment:

Get thee a gray cloak and hat,
And walk in Paul's among thy cashiered mates.

But quotations might be multiplied to show the many different kinds of business, and the different classes of people who were to be found in Paul's. Suffice it to say that it was the resort of all the idle, profligate, or necessitous people in London; but it was in addition the chosen haunt of all the young men of fashion or the 'gallants' of the day. In connection with this fact there is a celebrated allusion to a prominent object in the cathedral contained in the well-known words, 'dining with Duke Humphrey.' Perhaps the origin of that expression is not so well known as to render an account of it superfluous. There stood in the church a monument to the memory of one Sir Guy Beauchamp, but which was erroneously supposed to be the tomb of Humphrey, Duke of Gloucester, who was in fact buried at St Albans. From this mistake, the part of the cathedral in which the monument stood was called 'Duke Humphrey's Walk;' and here the gallant who had not the means to procure a dinner lingered, in the hope of an invitation to dine with some more fortunate friend. Failing this, he spent the dinner hour in company with the inhospitable monument, or, as the vulgar expressed it 'dined with Duke Humphrey.' Here, then, in Paul's the gallant was accustomed to show himself and his finery daily for a certain length of time.

The cathedral itself was at this period in a somewhat dilapidated state. In 1561 it had been struck by lightning, and the magnificent spire and part of the nave were destroyed. Not until 1633 were steps taken for its restoration; but, as is well known, the whole cathedral perished in the Great Fire of 1666.

Of the character and habits of some of the frequenters of St Paul's, a very good description is given in a curious little work written by Thomas Dekker, the celebrated dramatist. This book, which perhaps may not be very well known to the general reader, is called the *Gull's Horn Book*, and was published in 1609. It professed to be a guide to the fashionable follies of that not very refined but pleasure-loving age. Although it is written in a satirical spirit, it has nevertheless no small value for the light it throws upon the manners and customs of bygone English life. There is in this book an interesting chapter entitled 'How a gallant should behave himself in Powle's Walk,' which gives a minute description of how a young man should best parade himself and his finery, and pose before onlookers as an undoubted man of fashion. He is assured that if he walk by the rules given in this book, and there is no reason why he should not, Paul's may well be proud of him. Having chosen the door by which he intends to enter, he must in the first place be careful on entering to avoid the pillar where the serving-men congregate, and to bend his course directly to the middle line of the church with an air as if the whole body of the building belonged to him; where he may show off his clothes to the best advantage. One other warning is given, that by no means should he remain too long in the church at one time,

by which proceeding many are made cheap and ordinary, on account of their clothes becoming 'stale' and accustomed to the spectators. Rather should the gallant retire to a tobacco office or a bookseller's, where, if he cannot read, he can occupy himself with tobacco-smoke, and inquire who has writ against the divine weed. But if in departing from the church he should meet a knight or a squire, he must salute him familiarly as Ned or Jack, as by this means he will raise himself in the estimation of great men; and he is to be careful if possible to let it be known that he intends to dine at some well-known and expensive ordinary. After dinner, having changed his suit, if he have one to change, he must again appear in the Walk, this time using a toothpick in public, whether he has dined or not, for that secret is known best to his own stomach.

St Paul's was also a refuge for the unhappy gallant who was deep in his tradesmen's books, as the Duke's tomb was a sanctuary, and there the debtor might spend a winter afternoon very comfortably in talking, plotting, and laughing, and might even jest at his creditor to his face; while in the evening he might steal out by lamplight, and so cheat the bailiffs. But a true man of fashion must never enter the choir when divine service is being celebrated except on a high festival, and then only the better to show off his clothes. When the choir-boys, catching sight of his silver spurs, flock round him like a cloud of white butterflies to claim 'spur-money,' he is to take out his perfumed purse and to 'quoit silver into the boys' hands, that it may be heard above the first lesson, although it be read in a voice as big as one of the great organs.' This behaviour of the choir-boys actually during service would show a carelessness in the conduct of divine worship which would account for the poverty of the music in St Paul's, so much complained of by Mr Pepys in his *Diary*.

Another direction is curious. By no means is the gallant to lift his hat to another, unless the other's hatband be of a new fashion and three degrees quainter; but as all the fashions are to be seen for nothing in Duke Humphrey's Walk every day in the week, if any one fashion be fancied, the gallant has only to bring his tailor into the church and point out the fashion he prefers, whereupon the tailor may make his notes, and forthwith can immediately prepare a suit of clothes of the admired colour and pattern.

A mere country gentleman should by no means presume to walk in the principal part of the church until he has paid a visit to the steeple, where he may scrawl his name on the leads with his knife; or, if he cannot write, he may make the mark he puts upon his sheep, as by this means his name will lie in a coffin of lead when he himself is in his winding-sheet.

The last visit should be to the great dial, when the curious motion of the clockwork will repay the visit, besides the opportunity which it affords of showing the world the possession of a watch by taking it out and comparing it with the time of Paul's.

Such were the principal features of St Paul's and the occupations of its frequenters, a place of gossip, idleness, and business, which has passed away as though it never was. Since its day, manners and customs have undergone a vast

change, and even if much of the change be only external for the most part, none can deny the great improvement in our modern way of treating sacred places and buildings.

THE STOWAWAY.

A FEW years ago an affecting incident occurred in connection with the loss of a ship at sea. The vessel was wrecked in sight of land, and the captain, as in honour and duty bound, was the last to leave. When he was about doing so, he was suddenly confronted by a wretched-looking lad who had been concealed below—in other words, 'a stowaway.' Finding the lad could not swim, the captain deprived himself of his life-belt and gave it to the boy saying: 'Take this! I can swim.' The stowaway's life was saved; but that of the noble and generous seaman was lost. Much admiration was expressed at the time for the captain's heroic deed.

Yet it must be said that masters of merchant-ships have long felt these stowaways to be an intolerable nuisance, creating a difficulty with which it is hard to grapple. Ships sailing across the western ocean, Australian-bound vessels, and coasting steamers, are more particularly exposed to this constantly recurring annoyance than those for other destinations. Stowaways are not, as is generally supposed, working-men, who, failing to obtain employment at home, and unable to pay for their passage, conceal themselves in the hold of a vessel until she has left the port and the pilot is discharged; but consist principally of loafers and idlers who are too lazy to work, and thieves who have made their own country too hot to hold them.

The captains of ships which carry only cargo, and are not certificated to carry passengers, are liable to heavy penalties for landing stowaways in a foreign port, and are often deemed hard-hearted for putting them in irons and bringing them back to England. If a man is found in a railway train without a ticket, with intent to defraud the railway company, he is quickly handed over to the authorities and punished; and justly too.

In many instances where a stowaway is found, the captain makes the best he can of the case, and sets the man or boy to cleaning the brasswork or doing work which the stowaway does not relish; and before arriving at the port, causes him to sign the ship's articles at the nominal pay of one shilling per month, and on arriving at his destination, discharges him with a seaman's certificate for conduct and ability marked D, which can be of no subsequent use to him. In cases where the captain is brutally inclined, the stowaway is treated with much harshness. The writer of this has known many instances of stowaways, one of which, rather comical than otherwise, we will here recount.

The ship *A*—, commanded by Captain B., a good sailor and a kind-hearted man, sailed from the Tyne bound for Quebec for timber. The weather was very boisterous at the time, and owing to head-winds it was three clear days before she got through the firth and discharged her pilot. On the fourth day the mate reported that a stowaway had been found concealed in the hold,

and Captain B. decided to interview him forthwith. He proved to be an Irishman, in fair condition, and about thirty years of age.

'Well,' said the skipper, 'where did you come from?'

'Shure, and I came from down there, sorr;,' pointing to the hold.

'What do they call you?'

'They call me Mickey.'

'Well, Mickey, what do you work at on shore?'

'Shure, and I work at anything I can get, sorr.'

'How came you on board this ship?'

'Why, I was doing odd jobs in the docks, sorr, and I was tired, and I wint down there, and I fell asleep.'

'Do you mean to say that you have been down there asleep all this time?'

'Shure, and I have, cap'en. First whin I woke I heard the wishwash of wather, and it quite dark; so I lay down and wint to slape agin, and whin I wakkened it was dark; and ivery time it was the same, till somebody opened the trap there, and a chap came down and lugged me up here.'

'Have you had nothing to eat all this time?'

'Shure, I had a bit of bread and mate wid me.'

'Have you eaten it all?'

'I have, cap'en.'

'How much bread and meat did you take with you down there?'

'Och! a biggish loaf and about a pound of mate.'

'Had you nothing to drink, then?'

'Yis, I had a bottle wid some wather and a sup of whisky in it.'

'Is that the only coat and shirt you have?'

'Shure, and I have an ould coat and a shirt down there in me bundle.'

'Do you know where this vessel is going to, Mickey?'

'Shure, and it's going to Ameriky! Isn't it, cap'en?'

'It's going to Canada, man!'

'They told me, sorr, that Canady was in Ameriky.'

'Is there any one you know in America, Mickey?'

'Yis, sorr; there's my brother in Baltimore, and he wrote me a letther and said he could get me work.'

'How will you get to him from Canada, Mickey? You'll be as far from him as you were in England.'

'I'll walk it, sorr.'

'Well, Mickey, you're a stowaway, that's certain.—What shall we do with him, Mr H.?' turning to the mate.

'Pitch him overboard, sir,' answered the mate.

'Shure, cap'en, you won't do that for the sake of the wife and childher,' ejaculated Mickey in a tone of alarm.

'How many children have you?'

'Three, sorr; and I want to save up and sind for them, if me brother gives me work.'

'Well, Mickey, for the sake of the wife and children I'll not throw you overboard this time; but I'll tell you what I will do. You shall have the same to eat as the men, and sleep

in the fo'c'stle; you will turn out at five o'clock every morning; you will keep all the brasswork like gold; keep the fo'c'stle clean; get the coals up for the cook, and make yourself useful until the first dogwatch; and if I find a scrap of dirt on the deck at any time I'll stop your grub.'

'God bless you, cap'en; I'll do all you say, and more.'

Mickey became a paragon of iudustry, and was always at work, and the men kept him at it: 'Mickey, fetch me this;,' 'Mickey, fetch me that,' and poor Mickey was constantly on the trot. At last, one afternoon, the ship having entered the St Lawrence after being over forty days at sea, the captain sent for Mickey. 'Now, Mickey,' he said, 'it seems that you have behaved very well, and I am going to make a sailor of you.' Accordingly, Mickey made his cross upon the articles. The captain then told him that if he would promise to keep from the drink, and work steadily when he got to Baltimore, and save until he had sufficient to send for his wife and children, he, the captain, would pay his fare to Baltimore, and give him a few shillings to keep him on the way.

Mickey was very profuse with his thanks, and went on deck. 'Mickey, fetch me my tea,' shouted one of the hands from the forecabin; 'Bring me mine too,' called another; 'Get me a bucket or two of coals,' called out the cook.

Mickey looked quietly round. 'Och! be jabers,' he said, 'yez may fetch your own tay and coals, for I am a sailor now like yourselves.'

A short parley, accompanied by a kick or two, speedily induced him to resume his usual duties; and in due time the ship anchored off Byron's Wharf in Quebec. On the day following he was told to go to the shipping office, where the captain would discharge him. This was accordingly done; and giving him half-a-crown, the captain said: 'Now, Mickey, that will get you a bed to-night and something to eat. Be at G——'s store at six o'clock in the morning, and Mr G—— will take your ticket and see you off by the train to Baltimore, and give you a few shillings besides, for I have given him the money for that purpose this morning.'

Mickey took his departure in apparently anything but a satisfied mood at not handling the cash himself; but that same night, at about ten o'clock, some eight or nine roughs, accompanied by Mickey, invaded G——'s store and demanded the money. Failing to obtain their object by threats, they proceeded to violence; and the work of destruction had proceeded to such an extent that Mr G—— was fain to comply with their demands, and he gave up the money, which exceeded twenty dollars.

Some three days after, while the ship was lying at her anchorage, a wretched-looking object might be seen making his way to her across the booms, and, on reaching the deck, proved to be Mickey himself, embellished with blackened eyes, his nose knocked out of shape, his clothes in rags, and presenting altogether a most pitiable appearance. 'Is the cap'en aboard?' was his first inquiry. 'I want to see him.'

The second mate naturally asked him what he wanted him for. 'Never you mind. I want to see the cap'en.'

The officer went below and informed the captain of the unwelcome visitor.

'Tell him,' said the skipper, 'to wait on deck; and in the meantime tell the boatswain to stand by quietly with a good stiff rope's-end.'

On reaching the deck the captain was greeted with: 'Good-morning, cap'en! How are ye, sorr?'

'Who are you?' was the demand.

'Shure, don't ye know me, cap'en? I'm Mickey that yez brought all the way from England.'

'Oh! you are the vagabond, are you, that nearly smashed up Mr G——'s store with the help of your blackguard companions?'

'Shure, cap'en dear, what could we do? The bhoys and me wor drinkin', and we had no more money, so we only got what you left for me.'

'Well, what do you want now?'

'Well, cap'en, you see I can't get on in this country at all, and I want yez to give me a passage back to England.'

'I'll give you a passage, you vagabond, but not to England.—Boatswain, show him the way, and start him.'

The rope's-end came quickly into play; and the last that was seen of Mickey, he was stumbling and falling over the booms on his way to the shore, yelling vociferously as thwack after thwack was administered by the boatswain's muscular arm.

'The next stowaway I find on board my ship I'll treat Yankee fashion,' was the skipper's quiet remark as he dived below.

Whether Mickey remained at Quebec, or managed to reach his brother in Baltimore, or stowed away again on some 'homeward-bound,' history does not say.

PAPER-HANGING BY AMATEURS.

IN these days of artistic furnishing and decoration there is perhaps hardly any part of the subject which takes a more important place than the covering of the walls, which is usually accomplished by pasting over them patterned paper, and the art or trade of so doing is commonly called paper-hanging. We do not propose to bring forward in this article any art views about choice of paper or hangings, but rather to give a few practical hints about how to hang wall-paper in a neat and workman-like manner.

In the first place, it is well worthy of notice that the covering of walls with paper is a very cheap method of decoration. The same effect produced by any other means would be at a manifold increased cost. English wall-paper is twenty-one inches wide, and is sold in lengths of a dozen yards, varying from threepence or fourpence a length, or 'piece' as it is called, to half-a-crown and upwards. The more expensive papers are usually very thick, and have a quantity of gilt; but in these days of art workmanship, the designs and colours of the cheaper papers are often excellent. The cheapest papers are usually printed on a drab or gray ground, in very few colours; but in other qualities the ground varies according to the pattern, and is frequently of a very delicate shade, which it would be impossible to produce on a common thin paper. The amateur will also find that thick papers are

easier to hang than thin ones, and if he tries his hand at first on cheap papers, he will very likely find his attempts unsuccessful. Paper with a mottled surface is also easier handled than perfectly smooth paper. The thick Japanese paper which is now so much used is easy to hang. Of course it is a more difficult matter to hang a long strip than a short one, so, if you break up your wall, so to speak, with a frieze under the cornice at the top, and a dado at the bottom, you will, instead of having one long strip reaching from the cornice to the skirting-board, have three short strips—the frieze at the top, the dado at the bottom, and the body, as it is called, in the centre. The edges where these different papers meet will have to be covered horizontally with a border—that is, a narrow strip from one to four or five inches deep, according to the size of the room and the style of the decoration.

Naturally, the first question, when it is proposed to paper a room, will be: how much paper will be required? To find the quantity proceed as follows: Measure round the room, omitting doors and windows, with a measure of twenty-one inches. Next take the height of the room in yards. Never mind having a little margin to spare, as you will need something extra to paper over the tops of doors, and perhaps over windows; and it is well to have something to spare with which to make allowance when cutting the slips, so that the pattern may match. Multiply the number of yards by the number of twenty-one-inch breadths, divide the sum by twelve, and you will find the number of 'pieces,' of twelve yards each, which you will require. If you are going to do your work in three portions, you must work separate sums for frieze, body, and dado, when you have determined the depth of each. As a rule, an ordinary room of three yards high should have a dado of about a yard above the skirting-board, and a frieze of about half the width of the dado.

Now we come to the actual work. There is nothing in this which is beyond the powers of any one who has patience, and will make up his mind to work with deliberation, even if that means slow progress, and will not be tempted to go at the work slapdash. Everything which will be required is to be found in most houses, and there is therefore in amateur paper-hanging hardly any expense beyond the cost of the paper. There are only two stages of the work—the preparation of the wall, and the putting on the paper.

If there is only one paper on the walls, it is hardly necessary to remove this; but the joinings where the paper overlaps must be rubbed down smooth with sand-paper. Should there, however, be several papers, saturate them with water applied with a large brush, and when they are well moistened, tear them off. All picture-nails and hooks must be taken out. Bell-pulls and such things will be arranged for by cutting holes in the paper. The small holes left by nails will be sufficiently covered by the paper; but if there are any larger holes, they can be stopped with plaster of Paris, which only requires to be mixed with a little water to make it fit for use. Do not prepare more plaster than you require, as it cannot be mixed a second time.

We now come to the papering. It is supposed

that you have already a pair of steps high enough to allow you to reach comfortably to the top of the room; you will only require in addition paste and a large brush, the largest pair of scissors you can get, a soft banister brush, and a large square kitchen table. When you undo your rolls of paper, you will find that there is a blank margin on each side. One of these margins will have to be cut off, but which of the two is to be removed is a matter for consideration. When cutting off the margin, hold the scissors obliquely, so that the edge of the paper slopes to the under side. Lay the paper so that the margin which is left will be ready to receive the cut edge of the next strip laid over it. Begin the work at the corner of the room farthest away from the window, so that each strip as it is laid has its cut and overlying edge *away* from the light. This matter is not always attended to, but its object is to remove all appearance of the joinings as far as possible, for if they are towards the light they are sure to show. When you come to a corner, do not try to bend the paper round it, but cut it down as straight as you can to fit the wall, and lay the next piece on with the slightest possible overlap. A minute disturbance of the symmetry of the pattern will not be observed in the corner. It is far better in every case to make the pattern overlap a little, than to leave any portion of the wall or margin visible, the result of which would be entirely to destroy a neat appearance.

There are three processes in paper-hanging—measuring, pasting, and putting-up. It is a comparatively easy matter to measure the first slip, and we therefore begin with describing the proper way of pasting. The paste must have been thoroughly boiled and be free from lumps. It should be stiff, and should be laid on with a good-sized brush. Cut the slip to the required length, and lay it face downwards on the kitchen table. The strip will be probably too long to allow of its whole length being on the table at once. When you have pasted all that is on the table, do not draw that portion off, but turn it over pasted side to pasted side, and draw up the unpasted part on to the table. Turn over every part of the pasted paper, and gently pat it, so that the paste may be evenly distributed in any places which have not been completely covered by the brush. Take up the paper carefully, still turned over if it is a long strip; and if it is the first strip, fix it against the corner where you are going to begin. Bring the top edge under the ceiling or cornice or frieze-line, as the case may be; let the paper unroll itself, which it will do by its own weight; and gently pass the banister brush over it, so as to make it lie smooth to the wall. It will not lie perfectly flat while it is damp; but in a very short time you will find that it has contracted in drying, and is quite smooth and hard.

You will most likely be well pleased with the appearance of the first strip; but the difficulties have not yet begun. The second strip and succeeding ones have to be carefully measured and pasted on, so that there is an accurate joining of the pattern. To measure, proceed as follows: Go up the steps holding the end of the paper in the hands, and leaving the roll lying against the wall. Fit the pattern accurately at the top part; there will be a piece to

cut off at the top, and then keeping the paper in its place, mark off where it is to be cut at the bottom. Paste as before; proceed to hang, getting the pattern quite accurate, and not allowing any line or joining to appear between the two pieces. If the pattern does not quite match, it is of no use trying to make it do by forming a pleat or wrinkle. You must pull it off and try again. It is easy to pull the paper off without tearing it before the paste is set; but it must be handled gently. Take care that no paste gets on to the face-side of the paper, and never pass a duster across it, especially one damp with paste. There is no objection to patting down the edge, however, with a perfectly dry duster. Get the paper to lie against the wall by giving broad sweeps across it with the banister brush, and take care that no paste gets into the hairs of the brush. If the strip does not join up to the ceiling, it is easy to slip a little piece in underneath. Give your attention to getting a good upright joining and to keeping out wrinkles and creases, which, unlike the air-spots, which disappear as the paper dries and contracts, will remain on the wall, not a thing of beauty, but the opposite.

THE OLD HOME.

In the quiet shadows of twilight
I stand by the garden door,
And gaze on the old, old homestead,
So cherished and loved of yore.
But the ivy now is twining
Untrained o'er window and wall;
And no more the voice of the children
Is echoing through the hall.

Through years of pain and sorrow,
Since first I had to part,
The thought of the dear old homestead
Has lingered around my heart:
The porch embowered with roses,
The gables' drooping eaves,
And the song of the birds at twilight
Amid the orchard leaves.

And the forms of those who loved me
In the happy childhood-years
Appear at the dusky windows,
Through vision dimmed with tears.
I hear their voices calling
From the shadowy far-away,
And I stretch my arms towards them
In the gloom of the twilight gray.

But only the night-winds answer,
As I cry through the dismal air;
And only the bat comes swooping
From the darkness of its lair.
Yet still the voice of my childhood
Is calling from far-away,
And the faces of those who loved me
Smile through the shadows gray.

SOME CHRISTMAS PLEASURES.

IF life were all like Christmas Eve, what a splendid time of it we should have! Not Christmas Day; that is too much rest to be prolonged; but the busy Eve brimful of good-will. Good-will is the Christmas spirit; his face is smiling; the breath of his wings is warm; and wherever he is made at home, he brings the Christmas gift of peace, about which the angels sang long ago.

Now, though we can idealise good-will, as a festive spirit with light in his face and warmth in his wings, we must not stop at the poetry, or the real invisible spirit will not come and sit by our hearths. Some people do stop at the poetry; we all know that. Their good wishes end with the cards. Let us not be of the number. The words of greeting are all very well; but if they mean anything, they turn into deeds. The contriving and doing of these loving deeds is the best pleasure of the season; it is the secret of a merry Christmas. Let any one try the two plans, and practical experiment will prove the truth of our suggestions. Plan for one's self-enjoyment, and chiefly for one's self, and the best of feasting is but refined gluttony; plan to share all pleasures, and there is what Mrs Browning calls the lifting of things common till they rise and touch the spheres.

We are not going to deal here with bounty to the poor: from time immemorial, charity has outpoured during the great home festival, and outpoured, one might almost say, as a debt of the rich, from the royal dole down to the offering of the well-cared-for child to needy children. This we take for granted, to begin with; and turn to the other method of giving—the giving not of necessities, but of pleasure; and simple pleasure, after all, may be perhaps counted as a necessity, too, for human nature.

To look first at the home circle. There is a charming custom, coming, like the Christmas trees, from Germany: each member of the family smuggles into the house a gift for every one of the

others—not a present chosen at haphazard in a hurry, but something known to be desirable, sought out with care long beforehand, or made in secret, but in any case purchased out of trifling savings, and sometimes at the cost of little acts of self-denial on the children's part. Meanwhile, the parents have prepared the laden and lighted fir-tree; and the whole exhibition of universal present-giving is spread round the room, when at the first bell all assemble outside, and at the second bell the door opens and lets in the merry crowd to their feast of surprises.

The visit of Santa Claus is another custom that ought to be cultivated. The merest trifles please the little ones, if those trifles have got into their small stockings, hung ready on the end of the bed. Santa Claus came down the chimney in the night. To the children it is no superstition; in the depth of their mind they put him with the fairies, and with the doll that is half believed to be alive. Such a belief is understood to be a thing of imagination, like their plays of pretence.

Talking of children—among Christmas pleasures is the giving of a children's party on a sensible plan. The hours might be about four to eight; the meal simple and pretty; the playroom empty; a programme arranged to avoid awkward pauses; and lastly, perhaps, a Father Christmas. The mysterious figure enters with white wig and beard, and long brown cloak and hood dotted with artificial snow. He carries a holly branch for a sceptre, and a basket is slung on his shoulder. Out of this basket come various little treasures for the children; and while the younger ones accept them with awe, the elder ones begin to guess who is the visitor in masquerade.

To a certain extent, all sensible folks are inclined to be more simple and hearty, more like children, at this time of the year. Perhaps that is why the pantomimes still keep going. Now, if the pantomime has to be seen, how is it to be made into a great Christmas pleasure? Why, by securing the company of some hard-

working young acquaintance who otherwise could not go, who, perhaps, has never gone before, and who will be strengthened by an evening's amusement that will brighten half the coming year. This extra one in the party will give worth and value to the whole excursion, and the transient play will become precious. First, there is the clear cold night, the gay anticipation only more cheery for the frosty weather. Then the drive—at least to one of the party an unusual indulgence; the gayest spirit irrepressibly singing scraps of opera amid the jolting and rattle of glass, as the fun becomes infectious; then the anxiety about being in time, which is only a pretended anxiety, as everybody knows the rush has been made a whole delicious hour too soon, instead of a minute too late. Then breathless excitement—the street of the theatre is crowded from end to end. Wilder excitement still; the very last reserved places are secured, and by the most delightful chance, they are the very best in the whole house—at least the party think so, of course, and tell each other with much congratulation, for all goes smoothly to-night on the golden wheels of that one tender little kindness. Then there is the pleasant hour for cakes and programmes, and to our hard-worker it is, oddly enough, a treat to have tea at a marble table with a trim waitress in attendance. And at last, at last, back to the theatre, and up goes the curtain! The presence of the happy friend is as magic, turning that poor old tinsel pantomime into a most magnificent show. There never were such glorious scenes, bewildering to mortal eyes. There never was before, or since, so much to laugh at in a pantomime. We sit it out like children till the nursery tale has dissolved in confusion of splendour, and the clown has brought us down to earth with the string of sausages, and done his worst with the red-hot poker. And then we come out under the sparkling stars. Titania herself in fairyland,

Lulled by the flowers around her
With laughter and delight,

shall not sleep on happier pillow than ours after such a night. The joy of a tired heart has done it all; and by the touch, our tinsel pleasure turns to gold.

The time of holiday-making ought to last by rights from Christmas Eve till Twelfth Night. We may have to return to our occupations long before the twelfth day; but let us keep up the glow of mirth and rejoicing, and end with some home celebration, though we may not aspire to the old rites of the figured Twelfth Cake and the King and Queen.

During the first part of this festal time it is still not too late for carol-singing. The beautiful old carols ought to form part of the evening music in the house. Venturesome singers have before now surprised village neighbourhoods by singing with trained voices, incognito, outside the country-houses. A good deal of fun and daring accompanied the freak, and the money sent out to the minstrels was scrupulously forwarded to some local hospital.

Before the Christmas season ends, the New Year has begun. As the months pass, it takes one's breath away to remember with a sudden pause that this was the year we wished happy

for every friend we met. Before the autumn, if we consider our friends one by one, how little have our wishes turned into deeds! But here is a fresh chance; here is the truce of kindness, that comes in mid-winter like a strong sunshine for a fortnight. Let us make up our minds that 'a merry Christmas and a happy New Year' are to be empty words no more. It may be in our power to make them into realities.

And lo! while we have been thinking and planning, the angel of good-will has come to sit at home beside our hearths; and hidden in the folds of his raiment he holds the gift of peace. Why should he ever go away? Why should not the presence of good-will make life be all like Christmas Eve?

MR ESHOLT'S YOUNG WIFE.

A STORY IN TWELVE CHAPTERS.

CHAPTER XI.

'I FAIL to understand you, Mr Vampy,' Wilmot contrived to stammer. It seemed to him that his strange visitor, who was now nibbling a quill pen, had all at once taken leave of his senses.

Diving deep with one hand into an inner breast-pocket of his coat, Mr Vampy drew therefrom a tiny phial filled with a colourless fluid, which he held for a moment or two in front of the lamp and gazed at with his peculiar enigmatical smile.

'You would not'—gasped Wilmot.

'Nothing is further from my thoughts,' returned the other dryly. 'We may all live to be hanged, for aught we know, but it would be folly to hasten the day.' Then resting his elbows on the table, but retaining the phial in his hand, he said: 'What we have to do is simply to retard Mr Esholt's recovery for a little while, which is exactly what the contents of this phial will do for us.—No doubt, an overdose of it might prove fatal, but the same might be laid to the charge of half the specifics in the pharmacopœia. It is a vegetable essence, the secret of which was confided to me by an Italian whose life I had saved in a street brawl when I was a student at the Hôtel Dieu—for, strange as it may seem to you, I was originally intended for the medical profession. Curious way for a fellow to show his gratitude, wasn't it? Well, sir, such are the properties of my essence that six drops of it, mixed with an ordinary sized bottle of medicine, will induce in the patient who imbibes it a certain languor, a lethargy both of mind and body—a sort of lotus-eater's feeling carried to excess—which, so long as he continues to take it, will render him totally indifferent to all the ordinary duties and responsibilities of life and crave only to be let quietly alone.' Mr Vampy scratched his chin reflectively with his little finger. 'Unless I am mistaken,' he went on, 'I saw a bottle of medicine on the hall table as I came in.'

'I daren't do it,' exclaimed Wilmot in a hoarse whisper.

'As you please, *mon ami*, as you please,' answered the other as he put the phial back into his pocket. 'The twenty-fourth will soon be here. Should *Persephone* come in first, though

only by a neck, of course you'll be as right as a trivet; otherwise— But no; the reverse of the picture may be left to your own imagination—especially with Mr Esholt back at business.' He rose and pushed away his chair. 'I won't ask you to put your name to that little document for the extra hundred just now. I must, in fact, consult my firm before taking any further steps in the matter. It may perhaps become a question with them whether their wisest policy will not be to seek an interview with Mr Esholt himself in the morning, and at once bring the affair to a climax either in one form or another.' He moved towards the side-table on which were his hat and umbrella.

'Stop!' cried Wilmot as he sprang to his feet. 'Sit down again, Mr Vampy, I beg of you.'

Mr Vampy shrugged his shoulders slightly and did as he was asked.

Wilmot crossed to the door and, half opening it, stood for a moment or two listening; then he went quickly out, and after an absence of about a quarter of a minute, came back, carrying Dr Pyefitt's last bottle of medicine in its white paper wrapper. Resuming his seat, he said: 'Give me the phial. Six drops, you said, didn't you?' He broke the seals and drew the bottle out of its wrapper, but making a tear in the latter as he did so. His whole air and manner were those of a man wound up to the utmost degree of tension. Vampy handed him the phial without a word.

Wilmot uncorked the bottle and then the phial; but when he held them up in front of the lamp for the purpose of pouring the requisite number of drops from one into the other, his hands trembled so much that it was an evident impossibility for him to do so. Twice again he essayed, but to no purpose. Looking across at Vampy, he said: 'If you were to offer me a thousand pounds down I couldn't do it just now.'

'Infirm of purpose! Give me the bottles,' cried the other lightly. Wilmot needed no second bidding.

The ex-student's hands lacked nothing in the way of steadiness. In less than two minutes the transfer was effected and the bottle recorked and sealed up again in its wrapper with a stick of Mr Esholt's wax. Wilmot had looked on with fascinated eyes. When the sixth drop fell from the lip of the phial, a shudder ran through him. He felt at that moment as if he had just bargained away the immortal part of himself to the Evil One—or, which came to the same thing, to one of his agents in the guise of a little podgy man, dressed in shiny black, with two great black studs in his shirt front and an ill-concealed grin, half sarcastic and half contemptuous, contorting his commonplace features. What bliss it would have been to be able to clutch the little animal by the throat and fling him bodily out of the window!

'There is the bottle, which it may be as well to take back at once,' said Mr Vampy blandly. 'And here is the phial. Remember, six drops—no more and no less—to-morrow and every evening. There's enough here to last you a week; but before then I shall doubtless have seen you again.'

Wilmot left the room and replaced the bottle where he had found it. When he came back, Mr Vampy was drawing on his gloves. 'I won't say good-bye, but *au revoir*,' he remarked. 'As I'm so much overdue at another place, I will defer getting you to sign that note for the extra hundred till our next meeting.'

At this moment there came a tap at the door, and then a servant appeared. 'Mr Esholt would like to speak to you, sir,' she said to Wilmot.

'Good-night,' said Mr Vampy, holding out his hand, which the other took half unwillingly. Then in a whisper: 'Let us hope and pray that *Persephone* may win in a canter.'

'Mary, the door for this gentleman,' was Wilmot's sole reply.

Left alone, he stood for some moments with bowed head, one hand pressed to his heart, the other resting heavily on the table. 'And this is what I have brought myself to!' he muttered, with the concentrated bitterness of one in whose heart the fountain of goodness has not yet been wholly choked by vile weeds. 'Why did not that African fever kill me? Better so a hundred times than that I should have lived to sink to this!' With a sigh that was half a groan, he gathered up a handful of papers and slowly left the room.

Scarcely was the door shut behind him when the *portière* was lifted and Agnes emerged from her hiding-place. She was chilled to the bone through standing so long in the fireless room, but she had no consciousness of it. Heart and mind alike were overwhelmed by the terrible revelation to which she had been an unwilling listener.

'O Wilmot, Wilmot!' broke from her in a low agonised cry; and with it were scattered to the winds the dead ashes, never to be rekindled, of her first love.

She passed out of the room like a woman half tranced, with distended eyes, and hands that unwittingly touched the furniture as she passed. But when she reached the entrance-hall and her glance fell on the bottle, which was still where Wilmot had left it, her mind came back with a vivid shock to present actualities and all that it behoved her yet to do. Taking up the bottle, she hid it away in the pocket of her dress, then hurrying up-stairs to her room, she rang the bell. To the servant who answered the summons, she said: 'Let some one go at once to Dr Pyefitt's and obtain a fresh bottle of medicine. The one already sent has met with an accident.' The bottle she had brought up-stairs she locked away in her writing-desk.

She bathed her hands and face and fastened up her hair afresh, but it was all done automatically. She felt a strange sense of elation; she knew not whence it came, nor why, neither did she care to know. It was that species of mental elation, not necessarily allied to gladness, which comes to us at times after some great crises in life. She had parted from the past for ever. The time of weakness and doubting fears had gone by. Clear before her shone the path her feet must henceforth tread, not bordered with flowers, indeed, nor gladdened with sunshine as far as it was yet visible, but by no means unbeautiful to her eyes.

Mr Esholt's rooms opened out of a corridor

on the right of the landing, hers out of one on the left. She waited, listening, for nearly half an hour, till she heard the door of her husband's room open and shut; and then, standing in her own darkened doorway, her lamp having been turned down to a mere spark, she watched Wilnot go down-stairs. Now was her opportunity; her courage was high within her.

She had crossed the landing and reached the other corridor, when her husband's door was again opened, and Miss Esholt appeared, in the act of being wheeled out in her chair by Davry. Agnes came to an abrupt stand till Davry had shut the door behind her mistress and herself. Then, pale, resolute, defiant even, but never more beautiful than at that moment, she went a few steps nearer and said: 'Is that woman, that nurse, whom you engaged, coming to watch to-night by my husband's side?'

'I expect her here almost at any moment,' replied Miss Esholt with icy composure.

'Then you may request her to go home again. Her services are no longer required. From this time forward I shall nurse my husband myself.'

'If you choose to take the responsibility'—

'I do choose to take it. From this hour Mr Esholt will be under my care, and no stranger shall come between us.'

'You seem to have arrived at your determination rather late in the day,' answered Miss Esholt with an almost imperceptible sneer. 'You have doubtless been told that my brother is recovering; and if you choose to come forward now that the danger is over, and take all the credit of nursing him to yourself, you are of course at liberty to do so.'

'I did not come here, Miss Esholt, to bandy idle words. I have told you my intentions, and I mean them to be carried out.' Without a word more she passed the chair and its occupant and went forward into her husband's room.

'Well, I never!' exclaimed Davry with a sniff, as she began to propel the chair again. 'It was an ill day for us, mistress, when that peart young thing took it into her head to set her cap at th' master.'

'She has done to-day what she ought to have done at first. I admire her for it,' was Miss Esholt's reply.

Davry shook her head. Her mistress's speeches often puzzled her: this was merely one more added to the number. 'I've something to tell you about her when we are in our room and the door shut,' was all she replied.

Agnes passed through the dressing-room and, pushing the bedroom door softly open, looked in. Mr Esholt, gaunt and wan, his back propped high with pillows, lay staring at the opposite wall, but seeing nothing save with the mind's inward eye. His wife stood for a moment or two before advancing, and tears came into her eyes as she gazed. He started when she moved, and turning his head, welcomed her with a faint smile. She took his hand and pressed it to her lips, and then bending forward, kissed him very tenderly. Looking at her with a little surprise, he read in her eyes something he had yearned to see there ever since he had made her his wife, but had never beheld till now.

'Are you come to stay with me a little while?' he asked.

'I am come to stay with you a long, long time, dear Robert, if you will let me,' she whispered softly, with her cheek laid close to his. 'I have neglected you too long. Can you forgive me? I will never neglect you again.'

It was not the words merely, though they sounded like sweetest music in his ears, but the tone of heartfelt tenderness with which they were spoken that moved him to the depths of his being. A faint flush stole into his white hollow cheeks: he lay for a little while, her hand tightly pressed in his. 'But we must think of your health, dear,' he said at last. 'The nurse is used to sitting up, and'—

'You must let me have my own way in this. I do not intend that woman to come near you again; I do not intend to lose sight of you again till you are quite well; but I do intend to be obeyed. So not another word, if you love me.' She beamed down upon him with such a beautiful smile, that all the gloomy thoughts and forebodings which had held possession of his soul but a little while before fled before it, as the weird shapes which haunt the darkness flee before the coming dawn.

A little later Mr Esholt fell asleep, still holding his wife's hand. It was one of those refreshing childlike sleeps which sometimes come after the turn of an illness, and do the patient more good in a few hours than long days of nursing. Looking round after a time to note the arrangements for the night, Agnes all at once bethought herself of the bottle of medicine she had ordered to be fetched from Dr Pyefitt's. It ought to have been brought up-stairs before now, but this was Bridget's evening out, which perhaps accounted for the delay. She would go and fetch it herself while her husband was asleep; to ring the bell and summon a servant might disturb him.

When Wilnot Burrell was summoned for the second time to Mr Esholt's room, just as Mr Vampy was taking his leave, it was to receive his employer's instructions with regard to a certain statement, overlooked by him before, which he wished to have ready for Mr Kimber by the morrow, all the data for which were contained in certain papers Wilnot already had by him. When Wilnot came down-stairs again on his way to the study he was too much preoccupied to notice that the bottle of medicine was no longer on the hall table. The statement asked for by Mr Esholt involved a number of intricate calculations; but when he sat down to work them out, he found his mind so thoroughly unhinged by the scene he had gone through with Mr Vampy that the figures became a wild jumble in his brain; nor, despite all his efforts, could he reduce them to any sequence sufficiently coherent to enable him to work out the required result. At length he flung the papers aside. 'I'll turn out at six in the morning,' he muttered. 'My head will be as clear as a bell by that time. Meanwhile, a three or four mile stretch and a cigar will do me no harm. Confound it all! *Persephone must win*.'

He turned out the lamp, and taking the papers with him, he quitted the room. On crossing the hall this time his eye was attracted by the bottle on the table. It was singular, he thought, that it had not yet been taken up-stairs. Then something seemed to whisper to him: 'It is

not too late. There is a chance still left you. Take the bottle—hide it—break it, as if by accident—do anything rather than leave it to work out its fell purpose on the man to whom you owe so much!’ For a few moments there was a struggle within him; his fingers even closed round the bottle; but then came a thought which strangled his half-born purpose and hardened him again to the point of desperation. ‘Dare you face the chances of the twenty-fourth, unless you do this thing?’ and he acknowledged to himself that he dare not. He was on the point of putting down the bottle, when a sudden flash across his mind nearly blinded him.

This was not the same bottle as that into which Vampy had poured the six drops of his essence! The wrapper of that one was torn—he himself had torn it in breaking open the seal—while the wrapper of this was intact. Dr Pyefitt would hardly send two bottles in the course of an hour—that seemed absurd on the face of it—yet this was certainly not the bottle that had been tampered with. Why was this one here, and what had become of the other? He put back the bottle and went to his room, feeling more disturbed in his mind than he cared to own. A few minutes later he left his room, dressed for going out. As he reached the head of the stairs, Agnes was coming up with the bottle in her hand. He stood for a moment to allow her to pass. As she reached the topmost stair, her eyes met his. Never had he seen such an expression in them before—and it was on him, Wilnot Burrell, that the look was bent. He read in it repulsion, loathing, and contempt unutterable. ‘Agnes!’ he exclaimed, and then he stopped in utter amazement. But she swept past him without a word. A spasm, the like of which he had never felt before, constricted his heart as he gazed after her. What was the meaning of that look? Was anything suspected—anything known? And yet, how could there be? His interview with Vampy was enough to reassure him on that score. Still, Agnes’s inexplicable look, following so close on his discovery in connection with the bottles, was enough to render him seriously uneasy. He lighted his cigar and went forth into the cool night-air with many disquieting thoughts gnawing his heart-strings like so many birds of prey.

Agnes, finding her husband still asleep, sat down to think. The sight of Wilnot brought to her mind the necessity for at once asking herself a certain question which had already been floating vaguely in her mind. Ought she, or ought she not, to warn him?—that was the question. Ought she to tell him that all was known—that his nefarious scheme had come to naught—and that if he did not dare to face the consequences, he had better fly while there was yet time to do so? In a few hours at most, everything must be told to Mr Esholt, and it was impossible for her even to guess what action he might choose to take in the affair. She knew which course approved itself both to her heart and her conscience; but there was the duty she owed her husband to remember as well. Then there came over her the recollection of those old happy days at the vicarage when Wilnot and she were boy and girl together, before any whisper of love had been breathed between

them, and she hesitated no longer. ‘Surely it is impossible that he can be altogether vile,’ she said to herself. ‘There must be some “soul of goodness” in him yet.’ Taking a scrap of paper, she wrote on it, ‘All is known.’ Only those three words. They would suffice to warn him. Whatever action, consequent thereon, he might choose to take was a matter for himself to decide. Having sealed the paper, she rang the bell, and then went as far as the head of the stairs to meet the servant who answered it, to whom she gave the packet with directions to place it in Mr Burrell’s room where he would be sure to see it. Then she went back to her vigil, feeling as if a weight had been lifted off her heart.

THE DAILY PRESS AT THE ANTIPODES.

BY AN AUSTRALIAN JOURNALIST.

I SUPPOSE, in most particulars journalism, is carried on in Australia after much the same fashion as in England; but there are a few important differences, and under any circumstances the information I am about to give may be of interest to those who aspire to a high place in the ‘fourth estate,’ and who are looking outside the tight little island for a career. Nearly every large town in Australia has its daily; but what I shall refer to chiefly are the newspapers issued every morning or evening from the capitals; the others partaking of the character of local papers, and therefore being worked on an entirely different basis.

Probably few Englishmen are aware that in proportion to population, some of the Australian city dailies have a much larger circulation than any of the London papers. A Melbourne daily guarantees a circulation of over sixty-two thousand, and the colony of Victoria has a population of only a million; while an Adelaide office which issues a morning and an evening paper sells one copy to every eleven inhabitants of South Australia. The proportion is also very large in the case of the chief New South Wales and Queensland papers. Taking the whole issue of the dailies in the principal capitals into account, the circulation may be estimated as follows: Melbourne, one hundred and thirty thousand; Sydney, one hundred and thirty-five thousand; Adelaide, fifty thousand; and Brisbane, forty-seven thousand. Melbourne has fewer dailies in proportion to its population than any other capital; while Adelaide has, I believe, the most. Nearly all the dailies in the important capitals are very wealthy concerns, the net incomes in two or three cases averaging over forty thousand pounds each. I do not propose, however, to deal with the papers from a commercial point of view, but to allude to the conduct of the literary department, with the object of affording information to young British journalists.

The managers of the Australian dailies differ from those of the great European and American dailies in attaching relatively very much more importance to local than to general news. This preference is, however, gradually wearing away with the improvements in the means of communication, and the increasing attention given to the colonies by the outside world. A great change

has taken place in this respect in the last few years. The London and intercolonial telegrams occupy three or four times the space in a daily of the present time than in one of ten years ago. Still, on first coming to the colonies, Englishmen think it very strange that more general British news is not given in the colonial papers. Men soon get used to this, however; but I am afraid it takes years before English ladies cease to wonder how it is that the editors of their morning papers prefer local news to British politics and London gossip. The papers devote a considerable portion of their space to outdoor pastimes, particularly cricket and football, on account of the intense interest taken in these games by a very large section of the colonial public. Football is especially popular, every match in a capital between any two of the leading clubs being attended by thousands, comprising all classes of the community.

The editors of the Australian dailies vary considerably in their opinions upon the class of leading article most suitable for colonial readers. Those of some of the best papers care little about commenting upon the events of the hour, but set all their energies to work to obtain well-written leaders that compel the reading. It matters little whether the articles refer to social, scientific, or political subjects, so long as they are capable productions. Of course, when an important event, such as a great colliery disaster, occurs, a leader or sub-leader thereupon is required for the following day; and when parliament is in session, debates will often be immediately dealt with; but as a rule, subject gives way to treatment. Other editors, again, consider it their duty to fill two, three, or four columns of bourgeois type every day with leading matter upon current topics, and these do not appear to rank good writing as the first desideratum in a leader. Such articles are usually written in the office by permanent members of the staff, and are simply 'ground out,' as must necessarily be the case. A leader-writer goes to his office at eight or nine o'clock in the evening without perhaps the faintest idea of what his night's work will consist of; and he may then be called upon to write a leader upon almost any subject 'under the sun' for the paper of the following morning. It may be upon a boat-race, the discovery of a mine, a new code of police regulations, the weather, the arrival of distinguished visitors, the latest development in the theory of evolution, an unwise speech by a bishop, statistical tables, marine insurance, agriculture, something in regard to one of the Acts of Parliament, or, in fact, any subject which the imagination of the editor can conceive as being important just at the time. It may or may not be a subject upon which the writer is well informed; but in any case he takes the matter calmly from habit, and is soon setting his pen going. Such a paper has always a local subject for the first leader, and if there should happen to be nothing in particular stirring, the Blue-books are resorted to. The third class of Australian editor is a combination between the two already cited. He likes a local subject to lead off with, and keeps one or two stock leader-writers; but for the other leading matter he will have contributions from outside the office. He has always at his command half-a-dozen or more of the most able writers in the city for general

subjects; while he seldom fails to find a specialist to assist him when required.

The system of management of the literary staff varies throughout the colonies. In two or three of the principal papers in Melbourne and Sydney, the staff contains several members whose work is confined to one department, as in the case of the London dailies. But in the dailies of the other capitals there is seldom to be found a man who is the sporting editor, the dramatic editor, or the agricultural editor and nothing else. The sporting editor, for instance, may also be the dramatic editor, and may be called upon to report upon almost anything that does not require mere note-taking, from a new painting to a system of sanitation. Thus, it comes about that in cities of lesser importance, such as Adelaide, Brisbane, and Hobart, reporters gain a comparatively wide experience. Adelaide has the reputation of being the best Australian training-ground for reporters; and journalists who have been brought up or have gained their colonial experience there are to be found in responsible positions on nearly all the leading papers of the other colonies. From a reporting point of view, the experience of Australians is much the same as that of English scribes; but there is one department which has not, I believe, its parallel in the old country; this is what is technically known as 'doing the ministers,' or 'doing the departments.' On every daily paper in the colonial capitals one or two reporters are told off for this work, which consists of interviewing the members of the government and the heads of sub-departments, to ascertain if there is anything of public importance to make known. For instance, the reporter will ask the Commissioner for Trade and Customs whether any new light has been thrown upon a certain smuggling case; the Premier will be asked for the latest development of the New Hebrides question; the Minister of Water Supply for particulars of an irrigation scheme proposed to be carried out; and the Commissioner of Crown Lands for his opinion on a new rabbit exterminator. And colonial ministers are not particularly reticent, unless there is special cause for being so. The daily press has enormous power, and the ministers like to please the reporters. Moreover, they are mostly gratified if their names can be kept before the public, especially in connection with financial or land-law reforms. Often there is a perfect *rapprochement* between ministers and reporters. The reporter knows what he may ask and how he may ask it; and the minister knows that he is quite free in explaining a political puzzle to his interviewer, who will publish nothing likely to compromise his informant. After many years of experience, I never remember a falling-out between a minister and a reporter on account of a breach of faith. 'Doing the departments' sometimes occupies a reporter several hours in the course of a day; so it will be understood that the work is not light. The particular qualification required for this kind of interviewing is, of course, diplomacy.

Coming to the question of pay, a subject upon which perhaps British journalists are the least enlightened in regard to the Australian press, I may say that the editor of a daily gets from five hundred to one thousand pounds a year. I know one who had twelve hundred and fifty pounds; but the average may be taken at about seven

hundred and fifty or eight hundred pounds. On two or three papers there is a literary manager as well as an editor, but usually one of the proprietors fills this post. Sometimes, also, as in the case of the Adelaide dailies, the editor is a proprietor. A good manager when not a proprietor will get from six to eight hundred pounds per annum. Permanent leader-writers (on the staff) have from four to seven hundred pounds a year, and for this they each write perhaps five leaders a week. Outside leader-writers get paid from a guinea to three guineas an article. On some papers the usual pay is two guineas; on others, thirty shillings; and others, again, a guinea. For general contributions one pound a column is paid by some journals, and by others so much for the article according to its character and length. I have known a Melbourne paper pay five pounds a column (minion type) for a series of descriptive articles. Sub-editors get from eight to twelve pounds a week, the amount varying not so much in accordance with the ability of the sub as with the wealth of the proprietary. The work of the subs is much the same everywhere, and indeed if there is any difference, the worst paid have the most to do, inasmuch as on wealthy papers the sub-editor is allowed an assistant, who is paid from five to seven pounds a week.

The pay of reporters varies up to ten pounds a week, this wage, however, only being paid to one or two leaders of staffs. The leader of the staff on an average daily will receive seven or eight pounds a week; and capable reporters from five to nine pounds; but more than seven pounds is not often paid. The latter sum is the wage of the parliamentary hands in Melbourne; but such reporters must be good general writers, apart from their proficiency in shorthand. In Victoria, New South Wales, Queensland, and New Zealand, there are government Hansard staffs who give close reports of the proceedings in parliament, and are also called upon to report the doings of Royal Commissions and Select Committees of inquiry. The head of a government Hansard staff receives about six hundred pounds a year; the second in command, five hundred pounds; and the others from three hundred and fifty to four hundred and fifty pounds. It will thus be seen that good general reporters are not paid so well as government 'Hansarders,' though the qualifications of the latter are little more than a knowledge of shorthand writing. It is certainly an anomaly that a good descriptive writer who is also a fast stenographer should in the same city receive less remuneration for his services than one who can perhaps do nothing beyond the mere mechanical shorthand routine. It may be remarked, however, that many of the best government stenographers have been obtained from the newspaper offices.

There is no regular scale of pay for junior reporters. It used to be the custom of some newspaper proprietors in Australia to take articulated pupils for a term of from four to six years. There would be no premium, but, on the contrary, the indentured youth would receive a small salary—about thirty pounds a year to start with—which would increase by annual instalments until he was out of his time, when he would perhaps be taken on the regular staff at a wage of three pounds a week. If he showed himself capable, in three or four years he would be getting five pounds a

week; but it would depend entirely on his own exertions. The system of apprenticeship is, however, now dying out; but there is no lack of youths willing to enter upon the profession of journalism. From a monetary point of view, there can be no doubt that a lad has a better chance of moving forward in a newspaper office if he enters it as an ordinary beginner than by signing articles. But he must work exceedingly hard, be at the beck and call of the office for twelve or fourteen hours a day for months at a stretch, and at the same time must increase his general and local knowledge. The harder he works and the less he grumbles, the better it is for him.

I must not leave the question of salaries without referring to the special departments on the daily newspapers, such as sporting, commercial, agriculture, mining, &c. The commercial editor is usually some one outside the office, who is paid at rates varying from fifty to three hundred pounds per annum for supplying every day a short summary of the various market proceedings. The work required of the commercial editor varies greatly with the different papers, hence the wide margin between the lowest and the highest rate of pay. Only two or three Australian dailies have some one specially told off to look after the mining; but this department is becoming every day of more importance here, and ere long all the leading papers will require to have a mining editor. The remuneration of the share editors varies from fifty to two hundred and fifty pounds a year. It is usually a stockbroker who supplies the daily share list, with, in some cases, a few comments upon the state of the market. Then there is the shipping man, who is, except in South Australia, a member of the permanent staff, and is paid at reporters' rates. In regard to agriculture, sporting, the drama, and other departments, it is necessary to explain that each of the dailies issued in the Australian capitals publishes also a weekly paper (at sixpence, except in one instance where the price is fourpence). In some cases, the weekly is made up almost entirely from matter that has been used in the dailies; and in others nearly the whole of the reading is specially written for the weekly. The latter system necessitates a separate staff, and thus it is that the same proprietary may employ two sporting editors, two dramatic editors, and so on. There is, however, never more than one agricultural editor whose special province it is to write the weekly, this being considered essentially a country newspaper; but he also occasionally writes for the corresponding daily. Sporting editors on the most flourishing weekly papers receive about ten pounds a week, and in one or two cases assistants get about seven pounds a week. On the dailies, the sporting editor is not usually paid so highly, and if he has with sporting to combine dramatic and other work, he takes rank as a general reporter and is paid as such. Sporting editors are always members of the permanent staff; but dramatic and musical editors are not invariably so. The pay of an agricultural editor who is a member of the permanent staff is about ten pounds a week; but, as in the case of a sporting editor, if he has to mix up other work with his special duties, his remuneration is much less, the reason of course being that a special knowledge is required in the one case, while in

the other a smattering is sufficient. A good sporting and agricultural writer acquires a name throughout the colonies, which is at any time worth a fair income to him.

There is another class of men who have to be paid for services rendered to the dailies; these are the country correspondents. Each daily in the capitals must have a correspondent in every town, or even village (township is the Australian word for village) throughout its colony, some papers having as many as one hundred and fifty of these communicants. Every correspondent is supplied with a free paper, and is paid at the rate of one pound per column for reports, or a small fixed sum per annum by arrangement. In a fairly large country town—for the colonies—say of four thousand inhabitants, a correspondent may earn from forty-five to seventy pounds per annum; but the average is probably not more than ten pounds, for scores of small places in the farming districts might be deserted villages for all the history they make. As for correspondents abroad, a good daily will have two London correspondents—one for despatching cable messages, and the other for writing news-letters. The former will receive a salary of from four to six hundred pounds a year; and the latter will be paid at per letter usually three guineas. Sometimes the cable correspondent also writes the news-letters. Each of the dailies has also a correspondent at Paris, New York, San Francisco, and Port Louis, and some at other places. The intercolonial correspondence is performed on the exchange system throughout, except in the case of one Melbourne paper, which has a special Sydney reporter.

A word as to the class of men most likely to earn a living on the daily press in the colonies. Men who have failed at every other profession, and take up leader-writing as a *dernier ressort*, are of no use in the colonies. A middle-aged Englishman, no matter how good his education may have been, might wait for years before he secures a position on an Australian daily, unless he is a particularly brilliant writer, or comes with good credentials from a well-known British newspaper. A university degree carries no more weight in Melbourne or Sydney in respect to journalism than it does in London. A man is judged here, as elsewhere, by his work alone. Moreover, it takes a long time before an Englishman fresh to the colonies can become acquainted with the many phases of colonial politics, and consequently if he be ever so good a writer, the sphere within which he can work is very limited for, say, two or three years. As to reporters, smart young men who are good shorthand writers and who have had a little experience might do worse than come to Australia. The colonies are not overcrowded with good reporters, and the scope for journalists is rapidly widening. Two things must be remembered, however: one is, that the market could very easily be flooded; and the other is, that reporters with colonial experience are invariably preferred to others. If, however, a reliable and capable reporter comes to either colony and takes the first appointment that offers on a good daily whatever the salary, while he looks around and learns something of colonial life and politics, he will probably not regret the step. But he must not be afraid of hard work; and if he is of a genial temperament, so much the better.

In conclusion, I may point out that apart from the prospect of ascending the ladder of journalism itself, for an energetic young man the daily press here is not a bad stepping-stone to more remunerative occupations. A reporter in an Australian city becomes acquainted with the best men there; if he has his eyes open, he perhaps soon finds out whether there is a more profitable but equally congenial means of livelihood available than the one he is engaged in; and if he has a little money by him into the bargain, he has exceptional chances of turning it over to advantage. The number of reporters who have risen to good positions in colonial life is surprising. Two members of the Victorian government and the Minister of Education for South Australia were once reporters. A late premier of New Zealand, now a K.B., was also a reporter. This gentleman entered parliamentary life under rather strange circumstances. The story goes that he was sent to report a meeting of electors held 'to consider the most fit and proper person to represent them,' at which candidates were invited to attend. At the appointed time, no candidate put in an appearance, and the late premier, who was the only representative of the press at the reporters' table, was recommended by some one in the hall to come forward. He at once acted upon the hint, ascended the platform, made a brief speech, and at the election was returned unopposed.

MR MAGSDALE'S COURTSHIP.

CONCLUSION.

CHAPTER IV.—THE CRISIS.

A SMALL, frightened-looking man was making his way down Holborn at a rapid irregular trot; his hat was crammed well home on the back of his head, and his coat-tails streamed ungracefully behind him as he hurried along, edging and pushing his way amongst the throng of passengers. He carried a paper in his hand, at which from time to time he glanced nervously, as though its folds contained some dangerous explosive which might burst with disastrous results at any moment. It was Peter Magsdale; and the paper he held was Messrs Carrel and Stalker's letter, which he was taking post-haste to Allan for his inspection. He stopped at a door whose brass plate bore the legend, 'Magsdale, Architect,' and at once proceeded to knock double-knocks industriously until he was admitted.

'What on earth has happened?' asked his cousin as he rushed into his room. 'Sit down, and if anything has gone wrong, say so.'

Peter made a supreme effort to steady himself, and took a chair. Speech could not do justice to his errand, so he handed Allan the letter with as few words as possible.

'Read that,' he said—'read that, and tell me what to do. I got it this morning.'

Allan unfolded the paper, and leisurely began to study it, whilst Peter sat, holding on by the edge of the table, watching him with hungry eagerness.

We will exercise our privilege and look over

Mr Allan Magsdale's shoulder at the storm-fraught communication.

'CRESSBURN versus MAGSDALE.'

SIR—We are instructed by Miss Emily Parkins, the guardian of our client, Miss Mary Cressburn, to claim from you, on behalf of her ward, the sum of seven hundred and fifty pounds, in the name of damages for non-fulfilment of your promise to marry her said ward. We are authorised to accept the above sum in settlement; but should you repudiate liability, we shall be glad to be informed of the address of your solicitors, with a view to the institution of legal proceedings.—We are, &c.,
CARREL & STALKER.

TO PETER MAGSDALE, Esq.

Allan Magsdale read the letter through, and lay back in his chair, facing his cousin. 'I wonder you aren't ashamed to show that to me,' he said with infinite scorn.

Peter looked more wretchedly crest-fallen than before, but said nothing.

'When did you last see Miss Cressburn?'

'About a month ago,' faltered Peter.

'Not since you promised to take her to see Cornelia?'

'No,' was the half-whispered response.

'I can't trust myself to tell you what I think about it,' said Allan with indignant contempt; 'you'd better take it away.' He threw the letter at, rather than to, his cousin, and rising from his seat, turned his back on him, to gaze out of the window, with his hands in his pockets.

'Won't you tell me what I ought to do?' asked the miserable man after a long pause.

'Go to your solicitors,' said Allan without turning round.

'She thinks I've thrown her over,' said Peter.

'I never meant—I didn't intend to do that.'

'I don't know what else she could think.'

For two minutes Peter sat silent, staring at the carpet, and listening to the monotonous ticking of the clock: he cannot be said to have been thinking; he was lost in dazed dreams as to his position, not planning escape from it, but looking at it idly, as though it were the heading of a chapter he had not the inclination to read.

'For Heaven's sake, help me, Allan!' he wailed at length.

'What could I do, supposing I wanted to help you?' said his cousin, turning fiercely upon him.

'What shall I do?' moaned Peter. 'I'll marry her now if she will take me.'

'Wisest proviso you can make,' sneered Allan. 'How on earth you allowed things to come to such a pass, I can't think.'

'I thought perhaps she'd give way about knowing Cornelia, if I didn't go and see her for a time,' he said, a little less dolefully, for he thought that Allan was relenting, and would at least advise him how to act.

'Oh, you did, did you?'

'I did indeed. I never wanted to give her up.'

'Then you had better go and tell her so.'

Allan Magsdale returned to the table as he spoke, and looked over Messrs Carrel and Stalker's letter again. 'I don't believe Mary Cressburn has any thing to do with the despatch of this precious document.'

'Why?' asked Peter eagerly.

'Because,' replied his adviser, weighing his

words with sarcastic care, 'because she wouldn't pay you the compliment of saying you're worth the money.'

It was unpalatable; but Peter was too much engrossed with the theory itself to pay much attention to the manner in which it had been propounded.

'I'll go and see her to-night,' he said. 'Perhaps it isn't too late to—to make it all right still.'

'Perhaps it isn't,' said Allan. 'Meantime, you'd better go and ask Cornelia to lend you seven hundred and fifty pounds.'

Peter's face fell again. 'Do you really think they will press that?' he asked.

'I don't know; it would serve you right if they did; and you had better be prepared—unless you mean to let them take action.'

The shudder this shaft produced told Allan it had gone home, and he followed it up with another one.

'I shall like to hear what your sister says about the business; you might come and tell me, if you survive it.'

Peter squirmed like a piece of scorched leather, and feebly offered himself a shred of doubtful comfort. 'She need never know about it?' he said.

'I rather think she will, if she doesn't already, my friend. But I can't spend any more time over it just now; I'm busy.' And Allan sat down, and made a demonstration of selecting a pen.

Peter rose to go, but lingered about the door. 'Why do you think she must know?' he asked.

'Of course she'll hear about it,' answered his cousin sharply. 'Here, take your letter, and don't bother,' he added. He didn't want to console his cousin as well as 'advise' him, and was purposely dismissing him in as uncomfortable a frame of mind as possible—a worthy object, in which he quite succeeded.

Peter Magsdale went back to Somerset House, and pondered over the terrible muddle his procrastinating folly had led him into. He must see Mary Cressburn that evening at any cost, and so convinced was he of the necessity of this, that he did what he had never ventured to do before: he telegraphed to Mrs Bunshaw saying that an engagement would detain him until late. He could not trust to the chance of getting out after dinner if he went home as usual. When Miss Terripeg was not with them, his sister had always some good reason for keeping him at home: the Society's accounts to audit, or its correspondence to attend to. Anything but a direct exercise of her inflexible will, which that astute woman knew better than to bring into too frequent use.

'She won't believe it, and there's sure to be a row,' he sighed as he sent away the message; 'but I can't help that. I wish to Heaven I could see the end of it all!'

This threatened action for breach of promise looked dreadfully formidable; but surely he had nothing to fear from that. If he went down to Queen's Road and explained that he wished to adhere to his engagement, and had never any intention of throwing Mary Cressburn over, he could cut the ground from under her feet. If she consented to receive him again, he would be very much where he had been before; and if she refused to have anything more to do with him,

no proceedings she could institute would hold water for a moment. For the present he would continue to regard himself as engaged to her in spite of the solicitors' letter.

The day dragged slowly on; and at five o'clock he muffled himself up in his coat and went out to seek a restaurant where he could get his dinner. He dawdled over the meal until it was time to go down to Putney, and uncomfortable as he was about the meeting before him, he was almost glad that he had not much more time to brood over it.

He felt terribly nervous when he found himself once again in the little sitting-room he knew so well, where everything reminded him of Mary Cressburn. There over in the corner was the sofa on which they had been seated when he told his stumbling tale of love. That was the identical book she had trifled with whilst she listened to his professions of eternal devotion. Here was—Miss Parkins coming in, with hostility written on every line of her face. Any little remnant of courage he had brought with him vanished like smoke. Miss Parkins bowed to him without speaking, and seated herself rigidly on a chair, whilst Peter collapsed into the farthest seat he could find.

'Well, Mr Magsdale,' she said, 'what is it?'

'I wanted to see Mary,' replied Peter, with a very pale face.

'Mary does not want to see you, Mr Magsdale.—Did you happen to receive anything from Messrs Carrel and Stalker?'

'I came about their letter,' he said hesitatingly.

Miss Parkins' manner was so stern and uncompromising that his nervousness increased, and he could not go on.

'Yes, Mr Magsdale?' said the lady, by way of encouragement; then, seeing his disquietude, she continued: 'I am indebted to Mrs Cornelia Bunshaw for the recommendation to take legal steps.'

The shock was too much for Peter. 'Mrs Bunshaw!' he screamed, bounding from his chair—'Mrs Bunshaw!'

'Yes, Mr Magsdale. I called at Astley Villa a few days ago, and had the pleasure—Mercy on us!' exclaimed Miss Parkins, rising in her turn. 'Is he going to have a fit?'

It looked exceedingly like it, for Peter's eyes were starting from his head and he was trembling like a leaf. His faculties were hardly clear; but light was breaking in upon him: that must have been the 'case' she had spoken of so feelingly to Miss Terripeg and himself. But why had she concealed the fact that she knew him to be the sinner? He pulled himself together with a great effort, and turned to Miss Parkins. 'She didn't know you were referring to me?'

'Most assuredly she did, Mr Magsdale,' replied the lady, recovering her composure as Peter grew calm, 'though I did not know, when I first saw her, that she was your cousin.'

'Her cousin!' Cornelia had imagined that Allan was the faithless lover! She would soon be enlightened; it was only another slight addition to the muddle; a small one, perhaps, but still it would not improve matters. It would answer no purpose to explain the mistake to Miss Parkins, and he hardly thought of doing so; he

was too anxious to strike a blow at the impending legal measures.

'I came to say that I never meant Mary to suppose that I had deserted her,' he said.

'I'll tell her,' responded Miss Parkins tersely.

'I'm quite as anxious to marry her now as I ever was.'

'I'll tell her,' repeated the old lady.

'I still consider myself engaged to her,' continued Peter, to whom confession brought relief.

'I'll tell her,' was the only answer vouchsafed.

'May I not see Mary?'

'I think not, this evening, Mr Magsdale. I will speak to her, and let you know whether she wishes to renew your acquaintance or not.—Now you had better go.'

It had been an unsatisfactory visit on the whole, though he had accomplished his object in making it. Miss Parkins clearly understood that there were no real grounds of action against him, and his readiness to fulfil his engagement completely dissolved any that she believed to exist. He could not go home just yet; it was only half-past nine, and if he returned before Cornelia had retired for the night, he would have to submit to a searching cross-examination on the business which had kept him late. Moreover, if Miss Terripeg were there, he should be obliged to walk home with her, and the events of the day had not been of a nature to endear that task to him.

He turned northwards, and set out, striving to rest his brain by wearying his limbs. He walked far and fast, and it was long after eleven when he stood before his own gate. Everything was in darkness, and the household had evidently gone to bed. It was rather a nuisance, for Mrs Bunshaw had deprived him of that reveller's friend his latchkey soon after Allan's departure, and he would have to wake them up before he could get in. He rang once, softly, but disturbed no one. Then again, harder. Still no result. A third time violently, without producing any effect. He set to work and tugged at the handle until he heard the bell pealing wildly in the back premises, but still nobody appeared to be roused by it. He was very tired; and after his last effort, he sat down on the doorstep to rest, wondering what had happened within. Now sitting on one's doorstep is not a congenial occupation, or one conducive to health when indulged in at midnight in December, and before Peter had been there five minutes he had sneezed twice with resounding vehemence, and recognised with rising temper that he was 'catching cold.' Sternutation, however, did for him what the bell had failed to accomplish—a fact which would appear as inexplicable to us as it did for the moment to him, did we not know that Cornelia had been seated all the time behind her closed shutters, waiting with judicial patience until she considered it advisable to admit him. She heard him sneeze and remembered his delicate chest. It would never do to have him laid up; so, just as he took hold of the bell-handle again, a window was thrown open, and Mrs Bunshaw looked out, demanding to be informed who was there. When Peter saw his sister, he grasped the situation, and comprehended the singularly profound repose which enwrapped the rest of the household.

'It is I,' he answered irritably.

'Well, what's the matter?' asked Mrs Bunshaw in tones which would have led a casual hearer to suppose that it was Peter's acknowledged habit to sleep on the doorstep when he came home late. 'What do you want?'

'I—I want to get in,' replied her brother, with chattering teeth.

'Pray, do you know what time it is?' she asked.

'I don't know. I was detained (sneeze). I really couldn't get home any sooner' (sneeze).

Mrs Bunshaw referred his appeal to the higher court of Principle to obtain its views about the propriety of entertaining it, and a long pause was thus necessitated. 'I will let you in this time, Peter,' she said at length, as though by doing so she incurred grave responsibility. 'Miss Terripeg was here this evening, and I am much vexed at your behaviour.—There is the key,' she continued, throwing it down to him. 'I will speak to you about this in the morning.' Peter clutched the key, and let himself in, breathing a silent but earnest prayer of gratitude for the whim which had moved his sister to let him go to bed in peace.

The next morning he awoke with a cold so severe that he could not get up, and as Cornelia considered suspense had a softening and beneficial effect, she delayed calling him to account until the evening; but before then she had a visitor in the person of Miss Parkins, who came to tell her of the result produced by the solicitors' letter.

'I knew it would bring him on his knees,' said Mrs Bunshaw at the end of Miss Parkins' story.

'He is willing, nay, anxious to adhere to his engagement; and I think Mary will forgive him, being unaware of the means with which we have brought him back.'

'Our sole object of course is to secure your niece's rights,' said Mrs Bunshaw, after a minute's thought. 'If you will bring her to see me to-morrow, we will see what more can be done, though I do not think we can do anything further now.'

Miss Parkins took her leave, promising to bring Mary Cressburn the following day, and Cornelia went up-stairs to see the recalcitrant Peter. She found him seated by the fire, a hoarse and woe-begone victim of catarrh, and took up her station opposite him in solemn silence. 'I will say nothing about your late return last night, Peter,' she began after a time, 'nor will I refer to the occupation which detained you; for that you are sufficiently punished already. I feel it my duty, however, to speak to you very seriously about Anna Terripeg.'

Peter fidgeted and looked a shade unhappier than he did when she came in, but said nothing.

'You know that your demeanour towards her has not been that of an ordinary acquaintance.'

'I don't know how; she is no more than an ordinary acquaintance.'

'I can't believe that you mean what you say, Peter. During the past month I have looked upon her in the light of a sister.'

Peter muttered something about his willingness to look upon her in the light of a sister too; but the concession was unacceptable, and earned him a severe snub for his improper levity.

'She will be here to-morrow. She has never doubted that you mean to make her your wife; and to draw back now would be to jilt her—yes, to jilt her,' for he started at the word. 'You must speak to-morrow.'

The time had come to put an end to this dream of Cornelia's, and Peter roused himself to do it. Engaged as he was to Mary Cressburn, he could not allow it to go any further. 'If Miss Terripeg has any idea of the kind, Cornelia, your words, and not mine, have given it to her. I've shown her the usual civility due to a friend, and nothing more, in spite of your palpable efforts to throw us together, which I couldn't prevent.'

'I know what Anna thinks, and how she has come to regard you. She has opened her heart to me and shown me her inmost thoughts.'

'She wouldn't have done that unless you had given her sympathy and encouragement.'

'How could I refuse to sympathise with her, knowing her as I do, and believing in your honesty?—I will say nothing more now,' said she, rising; 'but before you meet her again, weigh carefully what I have said.'

'I have never said a word to Miss Terripeg that might not be said to any acquaintance.'

'Though you have bound yourself by no promise,' said Mrs Bunshaw in her most impressive platform tones, 'she has your unspoken pledge, which is as sacred, in the eyes of an honourable man. A relation of mine who breaks his word to a woman, need expect nothing from me when I have done with this world's goods,' she added, and she left him, after firing this as a parting shot. In her own mind she knew well that there was great truth in Peter's assertion that she had encouraged her friend to believe that he meant to marry her. 'But his attentions were so patent,' she argued to herself; 'he was always begging me to have her here, and used to be quite restless until he could have her to himself to take home.'

Up-stairs, Peter was reproaching himself with his share in the business, in happy ignorance of the crisis which was impending the next day.

Mrs Bunshaw had arranged a little tea-party, at which all our friends were to be present to witness the reconciliation of Allan and Mary Cressburn, and, if possible, the betrothal of Peter to Anna Terripeg. With regard to the latter couple, Cornelia had very grave doubts, but she meant to do her best to bring the engagement about.

Every one has arrived, and Mrs Bunshaw has gone away for a moment to call Peter; so Allan takes advantage of her absence to say something to Mary Cressburn. 'His sister simply rules him. I am certain that nothing but his dread of her interference made him so reluctant to let you know her. He came to me the other day after I last saw you, and was half mad at the idea of losing you, as he thought you meant to give him up.'

Allan was doing all he could to patch up the quarrel, and was on a fair way to success, for Mary knew nothing of Messrs Carrel and Stalker's letter.

She did not answer his arguments. She had told Miss Parkins that she had done with Peter and his love when her last letter to him remained unanswered. Had she been too hasty? Was he the poor weak but faithful creature his cousin

made him out? She loved him still, in spite of his neglect and the unmanly feelings which had caused it. Yes; if he would make amends now, here before his friends and her own, she would forgive him, but it should be his last chance.

Her thoughts were interrupted by the entry of Mrs Bunshaw and her brother. He did not know Miss Cressburn was in the house; but on being told that Miss Terripeg was there, he silently resolved to declare his engagement to the former in the presence of the latter. Whatever unpleasantness might result, it would put a final stop to the scheming which could only be productive of pain to one and vexation to the other.

Cornelia was posing for an opening speech, and did not see the start he gave when he found Miss Cressburn in the room; she gave rein to her organ of language at once, and proceeded to make everything nice and comfortable before she descended to domestic affairs and rang for tea. She addressed her cousin first, and the magnanimous kindness of her remarks would have moved most men of good feeling to tears. We deeply regret to record that the effect upon Allan was far otherwise. He grinned; openly and undisguisedly grinned.

'I was most unwilling to believe, Allan, that you had laid yourself open to suspicions which, if just, would have thrown so dark a shadow upon the hitherto unblemished name of Magsdale. I have invited you here this evening to meet Miss Mary Cressburn. I trust you have explained your conduct towards her, and earned my forgiveness by obtaining hers, for causing her to doubt that your promise'—

The looks of blank astonishment on three faces brought her speech, which was only gathering way, to an abrupt termination. Everybody looked at everybody else, and then stared so hard and meaningly at Mrs Bunshaw, that she paused.

Miss Parkins was the first to recover the use of her tongue, and she hastened to put Cornelia right. 'You are making some unaccountable mistake, Mrs Bunshaw. Your cousin, Mr Peter Magsdale, was engaged to my niece.'

'Peter!' shrieked Mrs Bunshaw and Miss Terripeg in a breath—'PETER!!'

The hero of this story saw that the moment had come. He walked across the room and took Mary's hand with doubting gentleness; she let him retain it, and he knew he was forgiven. Her presence strengthened him, and he spoke firmly: 'I am engaged to marry Miss Cressburn,' he said.

For a moment there was a dead silence. Cornelia stood pale but calm, gazing sadly on the pair before her. Her hopes and plans had been defeated; and she, in her blind anxiety to do what she thought right, had done much to destroy them. She would not betray her disappointment; she had undertaken to obtain justice for Mary Cressburn, and the identity of the lover was an element which must not be allowed to affect her pledge. She had, only yesterday, solemnly charged Peter to remember that a promise spoken or unspoken was a thing sacred, and she must not bid him retract the one he had given, now.

'Is this true, Peter?' she said in a low voice.

'It is quite true.'

Miss Terripeg, who had been eagerly waiting for his reply, fell back on the sofa in hysterics;

and Cornelia said her last word as she moved over to her assistance: 'You might have trusted me to stand your friend, Peter. For the sake of the girl you have allowed to suffer, and to whom you have so tardily made amends, I will not turn your enemy now. The mistake was mine.'

And this was the end of Peter Magsdale's Courtship, for he married Mary Cressburn three weeks later.

FIGHTING-COCKS IN SCHOOLS.

It is highly probable that the Romans introduced cock-fighting into England. This cruel sport was for a long period extremely popular amongst men and boys. One of the earliest if not the first account of the pastime being practised by school-boys occurs in a *Description of the City of London*, by William Fitzstephen, who wrote in the reign of Henry II., and died in the year 1191. He records that it was the annual custom on Shrove-Tuesday for the boys to bring to the schools their gamecocks, to turn the schoolrooms into cockpits, the masters and pupils spending the morning in witnessing the birds fight.

In many instances, teachers derived much of their income from payments made by their boys for providing fighting-cocks for this cruel and barbarous amusement. The masters generally claimed as their perquisites the runaway birds and those killed in battle. Our old school regulations and accounts contain many allusions to this subject. In the town accounts of Congleton is a payment: '1601. Payd John Wagge for dressynge the schoolhouse at the great [Congleton] cock-fyghte, 0. 0. 4.' Wreay School, on the banks of Windermere Lake, was famous for this pastime. Mr Graham, a Westmoreland Squire, bequeathed to the school a silver bell, to be fought for every year. 'About three weeks previous to Shrove-Tuesday,' says a well-informed writer, 'the boys fixed upon two of their schoolfellows for captains whose parents were able and willing to bear the expense of the approaching contest; and the master on entering school was saluted by the boys throwing up their caps and the exclamation of "Dux! Dux!" After an early dinner on Shrove-Tuesday, the two captains, attended by their friends and schoolfellows, who were distinguished by blue and red ribbons, marched in procession from their respective homes to the village green, where each produced three cocks; and the bell was appended to the hat of the victor, in which manner it was handed down from one successful captain to another.' This custom lingered until 1836.

A clergyman informed Mr William Henderson, for publication in his *Folklore of the Northern Counties of England*, issued in 1879, that when he was a scholar at Sedbergh grammar-school, Yorkshire, the master used to be entitled to fourpence-halfpenny yearly from every boy on Shrove-Tuesday for purchasing a fighting-cock. At Heversham, near Milnthorpe, says Mr Henderson, the cockpit was in existence close to the school a few years ago. The regulations of the Kendal grammar-school provided that it 'be free to all the boys resident in the parish of Kendal, for classics alone, excepting a voluntary payment of a cock-penny, as aforetime, at Shrovetide, &c.'

At the grammar-school of Grange-over-Sand, it appears from a local historian that gratuitous payment was expected from the parents of each pupil. It varied in amount according to the social standing of the parents, and at the commencement of the present century ranged from two shillings and sixpence to five pounds. The money was known as cockpence, and doubtless originated with the old practice of providing gamecocks.

Debts of fighting-cocks often formed important items in old school accounts. Here is an example drawn from Sir James Mackintosh's bill, from the master of Fortrose School: '1776-7. To cocks'-fight dues for 2 years 2s. 6d. each, 5s. 0d.'

The Duke of York in the year 1681 introduced the sport into Scotland. Two years later, a cock-pit was set up at Leith, and it attracted so much attention that, in 1704, the town-council of Edinburgh prohibited it as 'an impediment to business.' After much debate, it was finally agreed to confine the sport at Leith to one day yearly. The barbarous pastime soon became popular in schools, and masters managed to profit by it. In Sir John Sinclair's *Statistical Account of Scotland*, published in 1792, in an article by the minister of Applecross, county of Ross, it is stated the schoolmaster's income is 'composed of two hundred merks, with 1s. 6d. and 2s. 6d. per quarter from each scholar; and the cock-fight dues, which are equal to one quarter's payment from each scholar.' The Rev. Dr Edgar, in his *Old Church Life in Scotland*, referring to the school at Mauchline, states that 'the owners of the cocks paid to the schoolmaster a small sum in name of entry money; and those who did not provide a combatant had to pay an extra sum for admission to the spectacle. It was a gala day in the schoolmaster's calendar, for not only had he the benefit of pocketing the entry and admission money, but had the privilege of picking up the carcasses of the slain and seizing the persons of the fugitives.' 'Daddy Auld' stopped the sport at Mauchline in the year 1782. It was continued in other schools to a much later time.

Hugh Miller, the famous geologist, who was born in the year 1802, in his popular volume, *My Schools and Schoolmasters*, gives a graphic account of the amusement in the Cromarty grammar-school where he received his education. 'The school,' says Miller, 'like almost all other grammar-schools of the period in Scotland, had its yearly cock-fight, preceded by two holidays and a half, during which the boys occupied themselves in collecting and bringing up the cocks. And such always was the array of fighting birds mustered on the occasion, that the day of the festival from morning till night used to be spent in fighting out the battle. For weeks after it had passed the school floor continued to retain its deeply stained blotches of blood, and the boys would be full of exciting narratives regarding the glories of gallant birds who had continued to fight until their eyes had been pecked out; or who, in the moment of victory, had dropped dead in the middle of the cockpit.' Miller at some length denounces the cruel sport.

Church bells were often rung in England in honour of winning cocks. Kings frequently attended the battles. Henry VIII. encouraged the sport, and James I. greatly enjoyed it.

Cromwell prohibited it in the year 1658; but no sooner had the Second Charles ascended the throne than it was revived, and under royal favour was a popular diversion, and battles were fought in most unlikely places. It is stated in the parish register of Hemingborough, Yorkshire, as follows: 'Feb. 2, 1661. Upon fastene day last they came with their cocks to the church, and faught them in the church—namely, Thos. Middleton, of Cliff, John Coats, Ed. Widhouse, and John Batley.'

Several attempts were made to check this cruel pastime, and it was finally prohibited in the year 1849.

In the days of old, throwing at cocks was a popular sport. Its origin is almost lost in the dim historic past. Some writers trace it back to the time when the Danes ruled England. The foreign masters were hard on the Saxons, and held them in subjection which was as bad as slavery. The inhabitants of an English city determined to make a bold attempt for freedom, and formed a conspiracy against the Danes who were placed over them. It was resolved that on a certain dark winter's night a dozen brave men should secretly repair to the town-house, overpower the guard, and seize the arms which were kept there. When that had been effected, a signal was to be made, and the English were to leave their houses and slay the invaders. The operations had no sooner been commenced, than the noise made disturbed the cocks roosting in the building, and a loud crowing was the result. The unusual circumstance put the guard on the alert, who speedily ended the well-planned scheme of liberty. The Danes, it is said, doubled their cruelty to the conspirators.

After the English were freed from the Danish yoke, they are said to have instituted in the city the sport of throwing at cocks, in revenge for the misery their crowing had occasioned. The pastime became popular, and soon spread throughout the land. Shrove-Tuesday was set apart for the sport, being the day the effort was made to murder the Danes. In course of time, cock-throwing became an amusement recognised by parish officials, and it frequently figures in old accounts. The profits from the sport were frequently given to the churchwardens for the relief of the poor. The parish accounts of Pinner, near Harrow-on-the-Hill, may be quoted as an example: '1622. Received from the cocks at Shrovetide, 12s. 0d. 1628. Received for cocks in Tounne, 19s. 0d. Out of Tounne, 0s. 6d.'

The cock was tied with a piece of string to a stake driven into the ground, and a small sum was charged for throwing at it with short clubs. In later times, three throws for three-pence was the ordinary price. If the marksman killed the bird, or knocked it down and run and caught it before it regained its feet, it became his property. The cocks were trained to evade the blows of the throwers. It was a common practice for schoolmasters to provide cocks for the diversion of their pupils. Kings even engaged in the sport. In a copy of some household accounts we read: 'March 2, 7 Hen. VII. Item to Master Bray for rewards to them that brought cokhes at Shrovetide to Westminster, xxs.'

Many attempts were made to stop this sport. There is a charge of 2s. 6d. in the corporation accounts of Worcester in 1745 for crying down cock-throwing. A paragraph in the *Northampton Mercury* of February 1788 states: 'We cannot but express our wishes that persons in power, as well as parents and masters of families, would exert their authority in suppressing a practice too common at this season of the year—throwing at cocks, a custom which, to the credit of civilised people, is annually declining.' It lingered until a late period in many parts of the country, and was finally prohibited. At Wakefield, the magistrates stopped it about the year 1865.

THE LOST WAGER.

FORTUNE has queer methods of distributing her favours, and the way she showed her partiality for Gustavus Chuler was to give him a rich father. The head of the Chulers was not only an Alderman of the City of London and a Warden of a great Company, but he was also in the running, as Gustavus somewhat figuratively put it, for the Mayoralty Plate. In attending to his many offices, Chuler senior so succeeded in exhausting the labour market that nothing was left for Gustavus to do but play pool, billiards, stroll down Pall-Mall, and take to himself other soul-stirring and vigorous recreations. In this walk of life he was ably aided and abetted by a companion in leisure named Nathaniel Blossom, an ingenious inventor of expedients, not to catch Time by the forelock, but rather to push him along. By a stroke of fate, it happened that Gustavus one fine morning came across Mr Blossom in Bond Street, and after remarking on their happy conjunction, invited Nathaniel to walk with him. Some way down the street the pair stopped before the plate-glass front of Tompkins, their trusty and trusting tailor. Behind the window, in addition to the 'newest in tweeds,' there had lately been arranged a miniature Madame Tussaud's of stony-faced waxen figures.

'I say, Gus,' said Mr Blossom, in a thoughtful tone, 'what a lot of dummies Tompkins has got in his window! That's the way our money goes, old fellow, to clothe those wax beggars.'

Considering the many vain overtures Mr Tompkins had been making to Nathaniel for the settlement of his last little account, the providing of raiment for dummies could only by a stretch of the imagination be said to affect Mr Blossom's exchequer.

'I do believe,' went on Nathaniel, 'that our respected creditor puts them in the window to stare us out of countenance. There is one in the middle whose glassy eye goes through me. He seems to say: "Now, pay up, Nat, or into court you go." I can't stand it. I must quit the scene. Come!'

'Stop a minute,' cried Gustavus, detaining him. 'Have you ever noticed, Nat, what a resemblance even a living man bears to a dummy when he is standing in a tailor's window? I would

bet ten pounds that I could stand there all day and never be taken for anything but a dummy.'

'It is possible,' answered Mr Blossom dryly; 'but for all that, I'll take you. Ten or twenty?'

'By Jove,' exclaimed Gustavus, 'you didn't think I meant it as a bet, Nat?'

'I certainly did, dear boy; but of course if you say you didn't, why'—Mr Blossom made a movement with his hand, and blew in the air, as if he wafted Mr Chuler's rashness to the clouds.

'No,' replied Gustavus firmly; 'I am not going to slip out of it that way. Having made the bet, I stand by it, and, win or lose, I'm your man. Let it be ten.'

'Done!' cried Mr Blossom joyously.—'And now, friend of my soul, the goblet sip; let us seal the compact in the flowing bowl. Let an agile hansom convey us swiftly through the madding crowd to Italia's son, the dark-browed Tavalio, who is compelled by circumstances over which he has no control to conduct a restaurant in the Strand. There we will carouse.'

That night, due to the receipt of mysterious messages, the friends of both Mr Chuler and Nathaniel Blossom assembled in unwonted numbers at the house of entertainment presided over by the dark-browed Tavalio. Amidst the greatest excitement, Mr Blossom set forth the subject of the bet, and placed Gustavus in the position of a man of mark. A committee was hastily formed to promote the undertaking; and it was resolved that the time allowed for Mr Chuler to carry out his impersonation of the Living Dummy be one hour, and the place, the window of the suffering Tompkins, who, under threat of the loss of the whole custom of the gathering, was to give his consent. Then the party grew exceedingly merry, and the bosom's lord of Mr Chuler sat so lightly on its throne that he insisted upon standing champagne all round.

During the early part of the next day, Nathaniel Blossom received private information that his friend, Mr Gustavus Chuler, had, after much labour, won over the tailor to his cause, and that at three o'clock the same afternoon, the sartorial Tussaud's in Tompkins' window would be augmented by his living presence. A post-script further informed Mr Blossom that the bet would be declared 'off' if there were any grimacing through the window.

A trifle after three o'clock that afternoon, a curious proceeding might have been witnessed in Bond Street. Never before had so many fashionably dressed young men been known to take such an absorbing interest in the various samples of 'checks' and 'diagonals' in Tompkins' window; and never, in the memory of the oldest assistant, had there been such a review of impenitent debtors past the open door. The attitude of Mr Chuler was decidedly striking. Placed in the very midst of the tailor's dummies, and displaying to the utmost advantage the artistic cut of a suit of tweed 'Cheap at £4, 10s.,' his limbs had adopted a painful rigidity, and his countenance a fearful vacancy. Amongst those acquainted with the subject of the bet, the impression prevailed that it was a marvellous resemblance, and that Gustavus would win in a canter.

One of the most assiduous of the window-gazers was, as might be expected, Mr Nathaniel Blossom; and a quarter of an hour short of the time of winning the wager, this gifted gentleman was admiringly eyeing the motionless form of his accomplished friend. 'It's nearly over,' he said below his breath. 'He'll do it now, sure enough. He has acted a dummy to the life.—Why, what the dickens is the matter with him?'

The last ejaculation of the astonished Nathaniel was called forth by an extraordinary transformation which suddenly came over the countenance of Gustavus. The face of the Living Dummy grew ghastly pale, and his eyes became set in wild and terror-stricken frenzy, while his limbs visibly trembled beneath him.

'He is going to have a fit,' thought Mr Blossom. 'It has been too much for him. I had better go in at once and alarm Tompkins before he falls through the glass.' Turning round with this benevolent intention, Mr Blossom immediately became aware of a presence which caused him to become almost as violently agitated as his unfortunate friend; for, gazing directly over his shoulder, with every feature denoting amazement and fury, stood the portly form of Chuler senior. What the general public had failed to discover, had been quickly detected by the paternal eye. For a second or two Chuler senior stood as if petrified, as if discrediting the evidence of his senses; then, casting a lowering and awful look upon his unhappy offspring, he bounded into the shop. Hardly knowing what he was about, Nathaniel followed. Tompkins was standing in the middle of the shop rubbing his hands. With a wrathful brow, the scandalised candidate for first-citizenship strode up to him. 'Are you the proprietor of that peepshow in the window?' he asked in a choky voice.

The tailor, with a bewildered look, bowed obsequiously; he seemed in doubt as to whether the title of showman was meant as an honour or otherwise.

'Then,' thundered Chuler senior, turning an apoplectic tint, 'what inducements have you held out to my son to make an ass of himself amongst your wax monstrosities? What is the meaning of his ridiculous position, sir? Have you no better advertisement of your miserable tweeds and checks? Or is this a deliberate insult to me—to me, sir—an Alderman of the City of London?—Speak! or I'll do you a mischief on your own premises!'

Tompkins drew back and turned pale. 'It's only a little bit of a lark, sir,' he said soothingly. 'Some young gent's bet. Mr Gustavus is impersonating the Living Dummy.'

'The Living Dummy!' cried Mr Chuler, stupefied. 'A son of Mine—the Living Dummy!' He glared at Tompkins as if the tailor had answered him with a parable.

Further explanation, however, was unneeded, for at this moment the glass door which divided the shop from the window slowly opened, and the Living Dummy himself, looking very dazed and forlorn, stepped into view. The spectacle was too much for the author of his being, and the Alderman sank upon a chair. Gustavus followed his example, and, without a word, they sat and gazed at each other. For a while Chuler senior seemed in danger of suffocation; but at

last he found his speech. 'Send for a cab!' he gasped faintly.

Gustavus threw an imploring glance in the direction of the sneaking figure of Mr Blossom, and that friend of his soul instantly responded to it by going outside and hailing the vehicle required. Meanwhile, the news had got abroad that a member of the swell-mob had been taken in the act of impersonating one of the tailor's dummies with the object of a night-attack. As the alderman was the first to come out, he was identified with the culprit, and the remarks that were made upon him drove him nearly frantic. It was only when the abashed form of Gustavus crept into the cab, still unconsciously wearing the condemnatory card of 'Cheap at £4, 10s.,' that this illusion was dispelled.

By the next day's post Mr Nathaniel Blossom received from his friend Gustavus Chuler a lugubrious epistle, which set forth that the writer's state of health necessitated an immediate trip to the Highlands of Scotland. The envelope contained, in addition to this afflicting information, a Bank of England note for ten pounds, forfeit to Mr Blossom for a lost wager.

'SLOYD.'

OUR educational system, in one way and another, has recently been attracting a good deal of attention. One of the most significant signs of movement with the times is the Association just forming for promoting the teaching of 'sloyd' over the United Kingdom. This system has for some time past been an important factor in the educational systems of several European countries. The great beauty lies in the fact that it educates a child morally, physically, and mentally. Sweden was the originator of this system of manual instruction, which is not, as is frequently supposed, merely wood-carving, but is the system applied to the different kinds of handiwork for educational purposes. *Sloyd*, the Scandinavian word, which is termed 'sloyd' in England for convenience, means originally 'cunning,' 'clever,' 'handy.' The results at which the system specially aims is to implant respect for work in general, even for the coarser forms of manual labour; to develop activity; to foster order, cleanliness, neatness, and accuracy; to encourage attention, industry, and perseverance; to develop the physical powers and to train the eye and the sense of form. It is intended to teach all classes, from the highest to the lowest, how to use their hands as well as their heads, so that each man and woman may be placed in a position of independence and be capable of earning an honest livelihood.

We have been particularly fortunate in obtaining one of the chief Swedish authorities on the system in the person of Miss Myström, who has been engaged in London in adapting the system to English requirements. Active preparations are being made to instruct those desirous of becoming teachers. The course is arranged in series. The first article which learners have to make is a little pointer, using merely a knife

and glass-paper ; from such articles they proceed to more difficult ones—making rulers, inkstands, brackets, and so forth. Attendance at the classes is voluntary on the part of the pupil, so that there are certain conditions which the work must fulfil. It should be useful, and not too fatiguing ; the articles made should offer variety, and should not be articles of luxury ; they should be accomplished without help, and they should be real work, and not play. A necessary feature, too, is that they should demand thoughtfulness, and not be purely mechanical work. Many will no doubt here say, 'It is nothing more nor less than ordinary carpentering.' On consideration, however, it will be found there are several differences—first and foremost comes the difference in the *object* of sloyd, which is not to turn out young carpenters, but to develop the faculties, and especially to give general dexterity, which will be of value no matter what line of life the pupil may afterwards pursue. Other differences are—the character of the objects made, which are usually smaller than those made in the trade : the tools used ; the knife, for instance—the most important of all in sloyd—is little used in ordinary carpentry ; and lastly, the manner of working is not the same : the division of labour employed in the carpentering trade is not allowed in sloyd, where each article is executed entirely by each pupil.

Truancy has almost been done away with in Swedish schools since the introduction of sloyd. It has been found in all the schools where it has been introduced that greater and more intelligent progress has been made in the ordinary school-work. It makes children think for themselves. The system demands individual supervision and instruction, which is an advantage, as the teacher is enabled to gain an insight into the character, and to establish a personal relation between himself and his pupils.

In regard to the statement that it promotes the physical, mental, and moral development, we find that morally it implants respect and love for work in general ; it strengthens the bond between home and school ; and it fosters a sense of satisfaction in honest work, begun, carried on, and completed by fair means. Mentally, sloyd acts in drawing out and exercising energy, perseverance, order, accuracy, and the habit of attention ; it causes pupils to rely on themselves, to exercise forethought, and to be constantly putting two and two together. Physically, the system brings into action all the muscles, and exercises both sides of the body. Pupils work with the left hand and arm, as well as with the right, in sawing, planing, &c. Sloyd is particularly useful to the girls of our higher schools, and is more important for them than their sisters of the working classes. The former are sadly in want of some interesting active work to counterbalance the continual sitting and poring over books and exercises. Besides the general development it furnishes, the positive knowledge gained is of the greatest service, and serves to stimulate a growing experience of sympathy with men's work.

The first course for training teachers in England commenced in August, at the Ladies' College at Sydenham, which has been kindly lent for the purpose. Hitherto, those who would be teachers of sloyd have had to travel to the seminary

at Mäås, on the beautiful shores of Lake Savelingen ; and after going through the course there, have had to face the difficulty of applying the system to English tastes and customs. Now, they will not have quite so long a journey to undertake to gain instruction ; and the knowledge they do gain will be such as they can impart straight away to pupils. In order to counteract the evil of spurious teachers cropping up, there will be inspectors appointed, who will be allowed to visit any places where sloyd is taught at any time, to see that the system is carried out properly and faithfully.

From the foregoing sketch, some idea of the importance of this new feature in our educational system may be gleaned. The British people are slowly awakening from their lethargy, and are at length making a stir to place themselves on a more equal footing with our wary continental brethren. Sloyd is one step in the right direction ; for we want *whole* men and women whose faculties are developed to their fullest extent, and who have learnt to apply their knowledge not only in emergencies but in the daily events of life. We must not overlook the fact that all skilled work, however humble it may appear, is brain-work too. In a system of tried value like sloyd, if it is successful in taking firm root here, it is destined to influence a wide moral and social influence, and raise us in some degree out of our deplorable state of coma. In addition to its social and moral value, it is now widely recognised as the basis of technical education. Great things must not of course be expected all at once ; for not only have children to be made interested in such occupations, but teachers have to be trained to initiate them into successful methods.

IN THE TIME OF YULE.

ONCE more the dear old Yule comes round,
And hands, heart-warmed, close fast again,
While far and wide rings out the sound :
'Peace upon earth—good-will to men.'

New life, new strength, for coming years,
When souls are knit, in days to be,
By griefs and joys, by hopes and fears,
Of one great, grand humanity.

The common tie of common need,
The human tie of suffering,
May bind together hearts that bleed,
When life's glad bird no more can sing.

No bird can sing the whole year through,
No rose can bloom in Winter's blast,
And yet o'er hearts both brave and true
Some errant beam of light is cast.

And generous trust that looks above,
With noble aims and sympathies,
Shall teach the wounded heart that love
An infinite forgiveness is.

DARK DECEMBER DAYS.

As we reckon them, December days are the first of the winter ones; but from a climatical point of view the honour properly belongs to those of the previous month, when, as Burns said, 'the wind blows loud wi' angry sough,' and 'when chill November's surly blast made fields and forests bare.' But be that as it may, then the autumn has waned and winter is waxing, the almanac-makers notwithstanding. Some of the ancient weather-guides used to put this month down as having what they called 'halcyon days' in plenty, and yet others of them characterised it as stormy, squally, and most variable. As a matter of fact, there is a certain uniform strain of sombrous gravity about the days of December, with an occasional storm to dispel the monotony. Martial called those days smoky, and they are almost as misty and foggy as those of November, so that it is only by a considerable stretch of imagination that they can be styled anything like 'halcyon days.'

The evening of a December day has been pictured somewhat fantastically by the author of *Pickwick* in a striking sentence: 'The evening grew more dull every moment, and a melancholy wind sounded through the deserted fields, like a distant giant whistling for his house-dog.' It is not to be wondered at that the scene imparted a sombre tinge to the feelings of Mr Winkle, for this 'winter-month,' as our Saxon ancestors termed it, had a similar effect upon the poet Cowper. In December 1780 he wrote: 'At this season of the year and in this gloomy uncomfortable climate, it is no easy matter for the owner of a mind like mine to divest it from sad subjects.'

Dark, indeed, are the December days when the exceptional storms come on, for they are intensely realistic. As Chatterton forcibly put it: the 'rising whirlwinds, blasting, keen, and loud, roll the white surges to the sounding shore.' The snow, driving onwards, seems to alight nowhere, and it appears as if determined to hide every-

thing but itself from view. It is wonderful to see, yet not at all easy to stand, and that in a double sense. Nay, at such a time we are glad to be, as Emerson says,

Around the radiant fireplace, enclosed
In a tumultuous privacy of storm.

No herds go forth to seek the pastures now, either through the vales or over the mountains. Every warbler is silent except the friendly Robin, who now and then appears to forget what month it is, and so lets out his song quite unawares. The bee is no more heard, not even when the sun for an hour shines warmly, for there is no floral feast to entice. Not even a daisy is seen. Still, with all this dearth, there is something sublimely beautiful before us. On trees and shrubs thousands of crystals sparkle, and on a spotless robe of white at times we firmly tread. That robe, so downy, soft, and warm, serves as a coverlet, underneath which are tucked the plants and seeds for future bloom, and there they are sleeping and dreaming their dreams of the sunshine to come in the days of the spring.

It is not easy to keep from depression at this season. The days, now shortened to the briefest span, come tardily on, and as quickly get away again. The sun seems far off now, and its slender rays with great difficulty illuminate our sky at all. Indeed, John Keats summed December up accurately when he said:

The owl, for all his feathers, was a-cold;
The hare limped trembling through the frozen grass,
And silent was the flock in woolly fold.

Cold, of a truth, are the dark December days. Although the average temperature is said to be thirty-nine degrees, yet, as the farmers say, 'it is sometimes too cold even to snow.'

Low hang the clouds; and if there is gloom on the spirits or mist on the mind, then the icy chill which is in the air so influences, nay, even glammers the sight that wood and hill and field alike appear to wear the weary pallor and the painful stillness of despair. In some such condition the poet of the *Seasons* must assuredly

have been when he exclaimed of these days, 'Horror wide extends his desolate domain.' An old Minnesinger said truly, 'Men frown at these phenomena.' There is no real reason, however, why the variations of December should cause such a tinge of distaste; nay, the highest testimony tells the other way. The Bard of Ayr said of the storm itself, 'The tempest's howl it soothes my soul;' while the thoughtful singer of *In Memoriam* declares that

Well roars the storm for those that hear
A deeper voice across the storm.

But the dark December days are not altogether unlovely and unattractive. The skylarks collect in flocks, the woodcocks put in an appearance, and the rooks follow the plough with a most remarkable tameness. Flowers are not entirely absent either. Byron, we know, in a satirical mood, considered it as foolish to 'seek roses in December' as to 'trust in critics;' but it is not so unwise as the poet thought to seek, for 'the Christmas rose shall blossom, though it be 'mid snows.' Other flowers, too, display themselves occasionally. True enough, the trees would be leafless, mere 'rattling branches,' as Ambrose Philips called them, 'bare ruined choirs in which the sweet birds sang,' as Shakespeare inimitably expressed it, were it not for a few sear ones which cling as if with the clutch of death; but the mistletoe berries are ripening to transparency, while the hellebore, the protected polyanthus, the sheltered snowdrop and wallflower are in bloom; and the wading birds, as Gilbert White designates them, assume their winter plumage. There are always plants and flowers of which it may be said, as Shakespeare made Perdita affirm of rosemary and rue, 'these keep seeming and savour all the winter long.'

Confidence comes to us even in what have been styled drear-nighted December days. We know that it will not always be thus. The shadows will not continue to lie at such length across our path, the birds will not perpetually sit brooding on the snow, nor the milk constantly come 'frozen home in pail.' Nay, although the pastures lie in silence, like a deep calm sea, each morn and eve brings new promise of the glory that shall be hereafter, for to the imagination, even

In cold December fragrant chaplets blow,
And heavy harvests nod beneath the snow.

MR ESHOLT'S YOUNG WIFE.

A STORY IN TWELVE CHAPTERS.

CHAPTER XII.—CONCLUSION.

It was during the early hours of the following morning before any of the household were astir that Agnes made her confession to her husband. Mr Esholt had slept soundly during a great part of the night, but whenever he woke up for a few minutes there was his wife by his side, smiling and ready to minister to all his requirements. When he finally awoke there was upon him a sense of deep content and restfulness; the phan-

toms, bred of weakness and much solitary brooding, which heretofore had haunted his pillow by day and flitted on huge dusky wings through his dreams by night, had vanished utterly; instead, there breathed round him soft summer airs, and all his being seemed filled with sunshine and sweet music. 'O Love, of all magicians thou art chief.'

Then it was that Agnes began to tell her tale. First of all, she told by what chance she became a listener at the interview between Wilmot and Mr Vampy; and then she went on to repeat all that passed between the two, which, with that feminine gift of memory where dialogue is concerned, she was able to give nearly word for word. After that, she proceeded to narrate how she had locked up the first bottle of medicine and had sent for another to replace it; how she had met Wilmot for a moment on the landing; and how, after much inward perturbation, she had taken upon herself to send him three words of warning. Then she sat silent, not knowing whether her husband would approve or disapprove of this last action on her part.

He had listened to her in silence, but with the deepest attention. His first words were a great relief to her. 'You did quite right, dearest, in acting as you did. You have relieved me of a disagreeable duty. It would have been most painful to me to have to tell him verbally that which three words from your pen have made known to him. Forewarned is forearmed. His hand has been forced; he must needs make his next move within the next few hours, whether he likes it or not.'

He lay silent for a little while, evidently deep in thought; then he said: 'Poor Wilmot! Poor misguided young man! With all his faults, and they are many and grievous, I cannot help pitying him. Why did he not come to me when he first found himself beginning to flounder among shoals and quicksands? A helping hand held out to him at that time might have changed the whole course of his future life. And then how attractive he was—how every one seemed to take to him! Who could have believed such depths of dissimulation—and worse—lurked under so fair an outside! That he was in monetary difficulties I had some reason to know, and my intention was to challenge him on the point to-day, or, at the latest, to-morrow; but I could never have credited that he would lend his sanction to a plot so nefarious as that propounded by his last evening's strange visitor. But "smooth runs the water where the brook is deep."'

Agnes had not yet said all that she had made up her mind to say. 'Robert, are you aware that Wilmot Burrell and I were at one time engaged?' A vivid blush dyed her face as she put the question.

'It is only since I have been ill that I have become aware of the fact,' he replied. 'When I first asked Miss Granby's permission to speak to you about marriage, she told me that you had already been engaged, but that, owing to the change in your fortunes, the person to whom your promise had been given had seen fit to change his mind. I believe that at the time I expressed my opinion of his conduct rather strongly. Not for a moment had I any suspicion that young Burrell was the man in question; had I been aware of it, as a

matter of course he would never have set foot across my threshold. On this point, as on others, I was led away by his frank, sailor-like bearing, his contagious laugh, and his manner, which seemed as open and candid as the day; no doubt also, to a considerable extent, by my predilection for one who, leaving his own qualities out of question, was the son of one of my dear brother's oldest friends. My suspicion of the truth was first aroused by some trifle, I scarcely now know what, that day at Rushmere, and I then and there made up my mind to ascertain the facts of the case. Just at that time, however, I was much put about in business matters; and shortly after, as you will remember, I was called from home; while on the heels of my return came my present illness. Still, the subject had by no means escaped my memory; but it was not till Friday in last week that I ascertained, through a confidential channel, that which I wanted to know. I will not dilate on the feelings with which I heard the news. Unwittingly, I had done you a great injury, exposed you to a great temptation. But my faith in you never wavered for an instant. "Although it was my hands that thrust her into the fiery furnace, she will emerge spotless and unscathed." That was what I said to myself times without number. I could do nothing just then, my weakness was so extreme, but I never trembled for you in the least.' He lifted her hand to his lips and kissed it with all a lover's devotion as he ceased speaking.

There was still one matter more on Agnes's mind respecting which she felt that she ought to say something to her husband, and yet she hardly knew how to begin. She wanted to tell him about the torn letter she had found in his private drawer. It had been much in her mind during her long nightwatch, but the thought of it no longer rankled there as it had before. 'It was my fault that the letter was written which brought forth such a reply,' she said to herself. 'He loved me when he married me; and had I been a different wife to him, he would never have had occasion to make a confidant of any man.'

'There is one thing more I wish to confess to you, Robert,' she said with downcast eyes, for she recognised now what a breach of confidence she had been guilty of in reading the letter at all, although at the time the temptation had proved too strong for her.

'Confess away,' he answered with that smile in his eyes which softened his face so wonderfully. 'I promise you plenary absolution before you begin.'

'You remember that day when you gave Mr Burrell your keys and sent a message by him, asking me to open the private drawer in your study and give him a certain memorandum book I should find there? Well'—

'Stop a moment. I have no recollection of sending any such message.'

'But you must have sent it, dear, otherwise how should I have known anything about it?'

'Proceed.'

'On opening the drawer I found lying close by the book I had come for a torn portion of a letter, one of the paragraphs of which caught my eye. Then my curiosity overpowered me, and I took it up and read the whole of it.'

'There was no harm in that: you are my wife.'

'It was very wrong on my part. It was a great breach of confidence.'

'Tut, tut! It was nothing.—But do you happen to remember the contents of the letter?'

Did she not! She had felt at the time as if it would be impossible for her ever to forget them. 'I read the letter more than once,' she answered, flushing a little, 'and I have a good memory.' Then she repeated the letter to him almost word for word.

'My poor darling! and this has been rankling in your mind ever since? No wonder, either.'

'Had I been the wife I ought to have been to you, dear, had I been all that you had a right to expect, the letter would never have been written which called forth that reply.'

A curious expression flitted across Mr Esholt's face. 'If you don't mind the trouble,' he said, 'I should like you to go at once and fetch me that letter.'

Three minutes later she was back again. 'The letter is no longer there,' she said a little blankly.

'Of course it isn't,' he coolly answered. 'The same hand that put it there took it away.—Do you not comprehend?'

'No,' she said with a shake of her head. 'I am very stupid, I know.'

'To speak plainly, then—no such message as the one given you by Wilmot Burrell was ever sent by me. No such letter as the one read by you was ever received by me; consequently, it could not be an answer to anything written by me. Wilmot Burrell was the author of that precious effusion, or some one else for him. It was he who put it there; and it was he who took it away after it had served his vile purpose, which was neither more nor less than to sow dissension between the woman he once professed to love, but had cast off, and the man who had befriended him and at whose table he had broken bread. This is worse, infinitely worse than all that has gone before.'

Agnes was overwhelmed—powerless to give utterance to a word. What must her husband think of her after her confession that she had taken the forged letter as being in answer to one written by him! Blind idiot that she must have been to dream for one moment that Robert Esholt would under any circumstances have penned anything which could have elicited such a reply! Oh, how she had misread him! And yet, neither by word nor look had he reproached her.

By this time it was past eight o'clock. Mr Esholt rang the bell which hung by the side of his bed. To the servant who came he said: 'Go to Mr Burrell's room and tell him that I wish to see him as soon as possible.' Then, when the door was shut, he added sternly: 'Not another hour shall he remain under this roof.'

Presently the servant came back, looking somewhat scared. 'Mr Burrell is not in his room, sir, nor anywhere about the house. His bed has not been slept in; and his carpet bag, which was in his room last night, is not there now.'

'That will do, Bridget; thank you,' said Mr Esholt. Then turning to his wife: 'It is better so,' he said. 'Your brief warning was enough.'

He has solved the difficulty after his own fashion, and in all probability we shall never see him or hear of him more.—And now,' he went on, 'I will tell you something which may perhaps surprise you a little. Mr Vampy was a private detective employed specially by me. Some doubts having arisen in the mind of the holder as to the genuineness of the bill for the two hundred and fifty pounds, it was submitted privately to Jabez Kimber, who at once pronounced it to be—what it was—a forgery. Without a hint to Burrell, he at once came to consult me in the matter. After some consideration, I determined to take up the bill, although it would not fall due for some time. I was determined to so far shield the culprit that the settlement of the affair should become a matter between himself and me alone; but at the same time I was anxious and curious to know by what means he had proposed to himself to meet the liability when it should fall due. Behind the one transaction so fortunately brought to light might possibly lurk others more dangerous still. Hence my employment of Vampy—whose real name, however, is something altogether different—and I shall no doubt receive his report of last night's interview in the course of to-day. The idea of frightening Wilmot into consenting to tamper with my medicine was an emanation of his own over-ingenious brain, and ought in itself to have aroused the other's suspicions. I can only suppose his object to have been to ascertain to what extremes Wilmot would be prepared to go in order to screen his own turpitude. But it was rather absurd to suppose that a man who had come on the errand he was presumed to have come on should happen at that particular time to have about him a drug, or essence, possessing the remarkable properties attributed to it by him, and that they should be precisely the properties needed for carrying out the object he had so insidiously suggested. I think that had I been in Burrell's place the proposition would have had too much of the air of a prearranged scheme not to make me feel sure there was something more in the background. But one can never tell. No doubt Wilmot had been goaded to the point of desperation, and was scarcely master either of his thoughts or his actions. In any case, it is just as well that he has cut the Gordian knot in the way he has.'

When Dr Pyefitt arrived two hours later, he found his patient so much better that he was quite jubilant. 'Aha!' he exclaimed as he rubbed his hands gleefully; 'our last change of medicine seems to have effected a remarkable improvement. We cannot do better than persevere in it, I think.'

'Indeed, you can't, doctor,' replied Mr Esholt with a smile. 'The last medicine has done me more good than all that went before.'

But before this Agnes had gone to her own room. She had passed through so much during the last dozen hours that she was worn out both mentally and physically; besides, as Mr Esholt sensibly remarked, if she did not take a few hours' rest now, what would she be fit for when evening should come round again?

Dr Pyefitt had not been gone many minutes, when Miss Esholt was wheeled into her brother's room, Davy having first reconnoitred to make sure that Agnes had vacated her post for the time

being. Of course the sister's first words framed themselves into an inquiry after her brother's health.

'I am better, very much better, this morning. Even Pyefitt was struck with the change.'

'I am truly rejoiced to hear it, Robert.'

'I am sure you are, Janet.—By-the-way, I had a fresh nurse last night, *vice* Mrs Jukes superseded. But probably you are aware of it already?'

'Yes. Agnes told me what she was about to do. Seeing her so self-willed in the matter, I made no attempt to dissuade her.'

'You must make it right with Mother Jukes as regards money matters. She's a good creature; but when asleep, she certainly does snore like a trooper.'

'I have something to say to you this morning, Robert, which I would much rather have left unsaid, if the affection and duty I owe you would have allowed me to do so.'

'That's rather an ominous beginning, Janet; but go on.'

'What I have to say refers to Mrs Esholt.'

'To Agnes!' He raised his eyebrows slightly, and there came into his face a look she knew well—the keen, hard, slightly aggressive look which he habitually wore when at business, and sometimes forgot to lay aside at home. 'I am all attention.'

'Yesterday evening, a stranger—a gentleman, I suppose he would term himself—called to see Mr Burrell. Wilmot conducted him to your study, where the two remained shut up together for more than half an hour. Two minutes before the stranger's arrival, Mrs Esholt entered the study; three minutes after his departure, she quitted it. Consequently, she must not only have been present at the interview, but have known beforehand at what moment the stranger might be expected, and, one may reasonably assume, have been equally well acquainted with the object that brought him here.'

'Who saw all this? From whom did you derive your information?'

'From Davy. She saw Mrs Esholt both enter and leave the study.'

'So.—Anything more?'

'There's one thing more which I think you ought to be made acquainted with. About an hour later, Mrs Esholt gave Bridget a note for Mr Burrell with special instructions that it was to be sure to reach him.'

'Anything else?'

'Nothing else, Robert. I have thought it my duty as a sister to make these circumstances known to you, more especially following as they do upon certain other circumstances which I ought, perhaps, to have brought under your notice long ago—indeed, I now see how weak it was on my part not to have done so.' She paused, as if to draw a longer breath than usual. 'Brother, from the first hour Wilmot Burrell set foot under your roof my suspicions were aroused that there was some secret understanding between him and your wife, that they had, in fact, at one time been, even if they were not still, in love with each other, and that'—

'Janet, not another word, I insist!' broke in Mr Esholt in his harshest tones. 'All that you have told me since you entered this room is already known to me.'

'I have a little history to relate to you,' resumed Mr Esholt after a silence which to one at least of the two people there must have been anything but a pleasant one; 'and it may be as well that I should tell it you now, because it will serve to open your eyes on many points respecting which I was equally as blind as yourself only a few hours ago.'

The story Mr Esholt had to tell will readily be guessed, but not so easy would it be to divine with what varying emotions his sister listened to the recital. As it happened, she had not heard of Wilmot's disappearance, and now that she was told of it, it seemed only a fitting and natural climax to the strange story which had just been poured into her ears.

'Robert,' she said after an interval, 'I shall have something to say to you and Agnes in the course of the day, but for the present I will leave you.' With that she rang for Davy.

For two hours she sat in her room deep in thought. Had she, in truth, wronged her brother's young wife in her own mind from first to last? Robert's narrative had moved her far more deeply than he suspected. The girl must love her husband, love him sincerely, devotedly, whatever her feelings might have been towards another in time gone by, otherwise she would never have acted towards him as she had; she would never have revealed to him that which she had overheard by accident unless he, and not her former lover, held whole and sole possession of her heart. Could it be possible that she, Janet Esholt, had misread this simple-minded country parson's daughter from the first? If so, what a grievous wrong had she done her!

Pride and prejudice were two important factors in Miss Esholt's mental idiosyncrasy, but dominant over both was a strong inherent sense of justice. Hitherto, she had secretly prided herself that, whatever the cost might be to herself, she had never knowingly wronged or injured any one in word or deed; but could she truthfully affirm the same thing now? From the first, she had wronged her brother's wife, if not in word or deed, then in her thoughts, which are the unwrought actions of the mind. She had seen her, as she believed, walking straight towards a precipice (the word was her own), whether consciously or unknowingly she had never cared to ask, and had uttered no warning cry, had held out no saving hand. Had that catastrophe come about which she now shuddered to contemplate, would not the recollection of it have overshadowed her last moments, and have clogged the aspirations on her dying lips?

What her brother had told her had gone a long way towards breaking down the barrier of prejudices she had erected of her own free-will between herself and Agnes, and now her strong sense of right and justice did battle with her pride, and in the end overcame it. She acknowledged to herself, not without extreme bitterness of spirit, that she had been in the wrong; but with her such an acknowledgment did not fail to bring with it an unflinching determination to make such amends as lay in her power. That morning's solitary communion with herself was one she was not likely ever to forget.

When Miss Esholt was wheeled back to her brother's room, she found Agnes there, and for

the first time in her life she was glad to see her. She had never been a woman to hesitate or beat about the bush when she saw what she deemed her duty clear before her, and she was not going to begin now. She had a disagreeable task to perform, and the sooner she got it over the better for all concerned.

'Agnes,' she began, and it was very rarely she had ever called her by that name before, 'I have to ask your forgiveness for the wrong I have done you in my thoughts. I have been unjust towards you from the first day I saw you; but I promise you I will endeavour never to be so again. I have been blinded by prejudice, but am so no longer. Robert has told me everything. From first to last you have behaved nobly, and I respect you for it. I offer you my friendship, if you care to accept it.'

Agnes was deeply moved. Tears gathered in her eyes, and it was all she could do to keep them from falling. Crossing to Miss Esholt's chair and kneeling on one knee, she took one of her wasted hands and pressed it tenderly to her cheek. 'Not your friendship only, dear Janet, but your love—a sister's love. Nothing less will satisfy me. Ah! how I have longed for it and prayed for it since the first hour I knew you.'

Miss Esholt laid her other hand, which trembled strangely, on the young wife's glossy hair. 'Who can forecast the future,' she said gently, 'or say what may or may not come to pass in the days yet unborn?'

But little more remains to be told. Through Mr Esholt's liberality, Mrs Strake was enabled to take a much larger house, and in a much superior locality to the one in which she had vegetated for so many years. She was thereby made one of the happiest of women, for her house was always full of lodgers, indeed it was a common saying with her that if she had twice as many rooms to let she could find tenants for them; but in that case it is to be feared that she would have killed herself in her anxiety to please every one. Dear, kind-hearted Miss Maria—I ask her pardon—Mrs Ludford, who spent a month in Liverpool every year, never failed, accompanied by Agnes, to call upon her, on which occasions one may be sure there was much talk over old times, and trials which had now happily become mere bitter-sweet memories of the past.

After all, the Croxton Cup was won by *Persephone*. A few days later, Mr Esholt received two hundred and fifty pounds in bank-notes in a sealed envelope, accompanied by these words: 'From one who, being tempted, fell; who wronged you, but repents; and who now bids you and yours farewell for ever.' And a farewell, indeed, it proved to be, for no further tidings ever reached the ears of our friends with regard to the after-career of Wilmot Burrell.

A few years went by, and then a tiny Janet was toddling about the house, and a small Bobby was doing his best to tyrannise over everybody; and, strange to say, no one was more completely under their sway than the Aunt Janet whom they both loved so dearly. Infant caresses and the soft kisses of baby lips had broken down the last bolts and bars of the dungeon in which for years she had sat apart from all the hopes, fears, joys, and sorrows of her kind, and had let

in the blessed sunlight and the free sweet air of heaven.

Sometimes Davry would say to her mistress: 'Them bairns—bless 'em!—twist us round their fingers just as they like, and make right-down sillies of both of us.'

Miss Esholt seemed quite content that it should be so.

CONCERNING DOLES.

FEASTING at funerals may be traced back to remote times in the history of various nations. Amongst the Jews at an early period we find a commendable custom prevailing. It was the practice when one of their race died for the friends and neighbours to prepare the feast for the burial, so that those in the house of mourning might be spared additional trouble in their days of sorrow. Under the Greeks and Romans, the feasting in course of time took the form of sumptuous banquets. A redeeming feature of the usage was the practice of giving a portion of the provisions to the poor—a charitable custom, which induced the early fathers of the Church to continue funeral feasts. 'Doles were used at funerals,' we gather from St Chrysostom, 'to procure the rest of the soul of the deceased, that he might find his judge propitious.' The Christians were not content merely to give food; other alms were also distributed. St Chrysostom observes in one of his homilies: 'Would you honour the dead? Give alms.' Under the early Christians, 'this festival,' according to Mrs Stone, in *God's Acre*, 'was of quite a religious character, generally at the tomb of the deceased. There was divine service; the holy sacrament was administered, and a collection of alms made for the poor. There was a feast, shared both by the clergy and people, but more especially bestowed on the widow and orphan. The softening influence of grief was ever directed by the Church into heart-opening channels of charity and good-will. In time the amount and quantity of such doles came to be specially described and appointed in the will of the dying person.' The distribution of doles in England at funerals has come down to comparatively recent times. Even to the present day, in not a few instances bread is given at the graves of the persons who bequeathed it, and in this manner a custom is maintained which was instituted before the Christian era.

Torchbearers usually attended funerals in the days of old; they were poor men and women, who carried lights before the dead, emblematic of the glorified existence the departed were to enjoy beyond the grave. These people often received articles of dress in addition to food and money. Some interesting details have been recorded in which torchbearers played an important part. We find it stated that 'Eleanor, Duchess of Gloucester, in 1399 appointed that fifteen poor men should bear torches at her funeral, each having a gown and hood lined with white, breeches of blue cloth, shoes, and a shirt, and twenty pounds amongst them.' In 1411 we learn

that 'Joan, Lady Hungerford, appointed poor women to bear torches, and each to be clad in russet with linen hoods, stockings and shoes.' Twelve was the number of people in 1428 to bear torches at Thomas, Lord Poyning's funeral, and each was to receive a gown of black cloth and twelvence in money. Coming down to 1543, we find at the funeral of Andrew, Lord Windsor, twenty-eight poor men attended, and were rewarded with a frieze gown and sixpence.

At some places, doles were sent to the homes of the inhabitants; and bearing on this subject there is an important note in the *History of Leicestershire* by Nichols. In the account of Strathern, in Framland Hundred, it is stated: 'In 1790 there were four hundred and thirty-two inhabitants, the number taken by the last person who carried about bread, which was given for dole at a funeral; a custom formerly common throughout this part of England, though now fallen much into disuse. The practice was sometimes to bequeath it by will; but, whether so specified or not, the ceremony was seldom omitted. On such occasions, a small loaf was sent to every person without any distinction of age or circumstances, and not to receive it was a mark of particular disrespect.'

Of the many doles to be distributed on the tombs of the donors, a few may be named. On the 8th of October 1708, died at Hull, William Robinson—a gentleman who had formerly filled the office of sheriff of the town, a position only held by the leading inhabitants—left sufficient money to purchase a dozen loaves of bread, costing a shilling each, to be given to twelve poor widows at his grave every Christmas Day. Money was left at the commencement of the seventeenth century by Leonard Dare for purchasing bread for the poor of South Pool. In his will, dated November 28, 1611, he directed the churchwardens on Christmas Day, Lady Day, and Michaelmas Day, 'to buy, bring, and lay on his tombstone threescore penny loaves of good wholesome bread,' and to distribute the same to the poor of the parish. If the instructions were not observed on the foregoing days, the will provided that a pound a year be paid to the mayor and burgesses of Totness. John Smith of Acklam, Yorkshire, died in 1681, and left two pounds per annum to the poor of the parish, to be paid on his tombstone. Over the remains of another Yorkshireman, in the churchyard of Kildale, is a tomb bearing an inscription as follows: 'Here lyeth the body of JOSEPH DUNN, who dyed ye 10th day of March 1716, aged 82 years. He left to ye poor of Kildale, xxs.; of Comboundale, xxs.; of Danby, xxs.; of Westerdale, xxs.: to be paid upon his gravestone by equal portions on ye 1st May and ye 11th November for ever.'

Two quaint customs are still enacted annually in London on Good-Friday. The vicar of St Bartholomew's the Great, Smithfield, drops in a row twenty-one sixpences on a certain lady's grave. The money is picked up by the same number of widows kneeling, having previously attended service at the church where a sermon is preached. The details of the other charity are singular. Peter Symonds, a native of Winchester, who followed the trade of mercer in London, by his will, dated 1586, left a sum of money for a sermon to be preached in the parish church of

All-Hallows, Lombard Street, London; and at the close of the service, sixty scholars of Christ's Hospital are to be presented with a bunch of raisins and a bright penny. He further left property for purchasing sixty loaves of bread to be given on Whitsunday to poor persons on his grave in Liverpool Street. The railway now covers the site of his tomb, and the bread is distributed in front of the schoolroom in Bishopsgate churchyard. Symonds did not forget the claims of his native city, and left to its inhabitants several charities, including the founding of an almshouse for the perpetual maintenance of six poor old unmarried men and four poor young children. He also provided for keeping a poor scholar at Oxford and one at Cambridge. Respecting another of his bequests, some strange directions were contained in his will, as follows: 'Leave was to be obtained from the bishop or the dean to place his picture in the body of the cathedral, with a small table before it, on which were to be placed twelve penny loaves of good wheaten bread, which immediately after the service were to be given to twelve poor persons at the will of the mayor; except on one Sunday in each quarter, when the bishop or dean was to nominate the recipients.'

At a little later period, another remarkable bequest was made to the city of Winchester. Richard Budd, a native, and a resident there, left a sum of money to the dean and chapter on condition that they had tolled the great bell of the cathedral, and had read certain prayers prior to the execution of condemned prisoners in the city.

Robert Dowe, on the 8th of May 1705, gave to the vicar and churchwardens of St Sepulchre's Church, London, fifty pounds on the understanding that through all futurity they should cause to be tolled the big bell the night before the execution of the condemned criminals in the prison of Newgate. After tolling the bell, the sexton came at midnight, and after ringing a hand-bell, repeated the following lines:

All you that in the condemned hold do lie,
Prepare you, for to-morrow you shall die:
Watch all and pray; the hour is drawing near
That you before the Almighty must appear:
Examine well yourselves; in time repent,
That you may not to eternal flames be sent:
And when St Sepulchre's bell to-morrow tolls,
The Lord above have mercy on your souls!

Next morning, when the sad procession passed the church on its way to Tyburn, a brief pause was made at the gate of St Sepulchre's Church, and the clergyman said prayers for the unfortunate criminals, and at the same time the passing-bell tolled its mournful notes.

Sir Roger de Tychborne was a valiant knight who lived in the days of the second Henry. He resided in a stately Hall in Hampshire. His wife, Lady Mabella, was the means of the celebrated 'Tichborne Dole' being instituted. 'This dame,' so runs the old legend, 'being bedridden and extremely ill, petitioned her husband for the means of establishing a dole of bread, to be given to all poor persons who might ask for it on every succeeding feast of the Annunciation of the Blessed Virgin Mary. He promised her as much ground as she could walk round in the neighbourhood of the house while a certain brand or billet was

burning, supposing that, from her long infirmity, she would only be able to go round a small portion of his property. The venerable dame, however, ordered her attendants to convey her to the corner of the park, where, being deposited on the ground, she seemed to acquire a renovation of strength, and to the surprise of her anxious and admiring lord, who began to wonder where the pilgrimage might end, she crawled round several rich and goodly acres. The field which was the scene of her extraordinary feat retains the name of the "Crawls" to this day. It is situated at the entrance of the park, and contains an area of twenty-three acres. Her task being completed, she was reconveyed to her chamber, when, summoning her family to her bedside, she predicted the prosperity of the family while that annual dole existed; and left her malediction on any one of her descendants who should be so mean or covetous as to discontinue it, prophesying that when this happened, the family would become extinct from failure of heirs-male, and that this would be foretold by a generation of seven sons being followed immediately after by a generation of seven daughters and no son.'

In years ago, about nineteen hundred small loaves of bread were baked and given to those who made application for them, and if any persons remained unserved after the doles had been distributed, they were presented with twopence each. Men and women came from all parts of the country; and even a week before the doles were given away, a number of folks assembled in the neighbourhood to await the event. It gave rise to much rioting; and about the commencement of the present century, the doles were discontinued, and in their place a sum of money was given to the neighbouring poor. Superstitious people used to preserve the bread as a certain remedy for several ailments, notably ague.

In Anthony Trollope's novel *Barchester Towers*, there is a graphic picture of the Hospital of St Cross, near Winchester. It is called 'The Almshouse of Noble Poverty,' and no wayfarer has presented himself at the door of it since the days of King Stephen to the present hour who has not been entitled to receive a meal of bread and beer. The stranger has only to knock to receive a horn of ale and a dole of bread, known as the 'wayfarers' dole.' These charities were once common in this country; but we believe the Hospital of St Cross is the only one which remains. In the days of yore, a charity existed at Sprotborough, near Doncaster, somewhat similar to that at Winchester. On a cross bearing a brass plate were the following lines:

Whoso is hungry, and lists well to eat,
Let him come to Sprotborough for his meat;
And for a night and for a day,
His horse shall have both corn and hay,
And none shall ask him when he goes away.

Mr Tuke of Wath, near Rotherham, died in the year 1810, and he bequeathed one penny to every child that attended his funeral. Nearly seven hundred were present. To every poor woman in Wath, ten shillings and sixpence. Instructions were left by him for the ringers to ring one peal of grand bobs, which were to strike off while he was being put into the grave. He left seven of the oldest navigators one guinea for 'puddling him

up' in his grave. Several other bequests were included in his will, including forty dozen penny loaves to be thrown from the church leads at twelve o'clock on Christmas Day for ever.

Doles of bread are given every Sunday in the parish church of Hessele and in several other churches in the neighbourhood of Hull. We have observed the same custom in other parts of the country.

Doles of fish are very numerous, and with particulars of a few examples we close our paper. John Thake, in his will, drawn up in 1537, left his house and land on condition that his heirs, annually on Friday, in the first week in Lent, gave to the poor of Clavering, in Essex, one barrel of white herrings and a cade of red herrings. At Dronfield, Derbyshire, in 1577, Richard Stevenson left half a hundred of herrings, and as much bread as could be made from a 'strike' of good wheat. The doles were to be distributed every Friday during Lent for ever. At Farnham Royal, Buckinghamshire, in 1664, David Slater gave money to purchase bread and herrings and a pair of kid gloves annually for the parson of the parish for the time being. The gloves were to be purchased ready for the first Sunday in Lent. At Newmarket, in Suffolk, there was a bequest of fish and fagots.

A FORECASTLE YARN.

THE long hot day was over, and with the setting sun had come a breeze, before which the good ship *Bristol* was silently slipping through the oily-looking water. Six bells had just been struck; the saloon was almost deserted, and the poop was peopled with weary passengers, revelling in the soft cool wind and the departure of our enemy the sun. The maindeck was alive with the midship passengers, and the watch on deck, who, mixing indiscriminately, lounged and chatted and smoked and slept as their inclination moved them.

I had come up on the forecandle-head to enjoy a quiet cigar and to delight my soul with the wondrous beauty of the night. Up here, everything was quiet, and I was alone, save for the man on the lookout, who leaned on the opposite rail as motionless as a statue, and evidently occupied with his own thoughts. Looking aft, the ship was almost in darkness, being shadowed by the mountain of canvas which rose dim and mysterious towards the sky. The murmur of voices was hushed into a kind of lullaby, under whose drowsy music both ship and ocean seemed to be dreaming. Overhead, the tropical stars hung out their white lamps against the violet sky, and sent long trails of light glittering across the dark water until they broke in crystal shivers on the hull. The light from the open ports of the saloon looked hot and yellow, and only enticed a dull reflection from the sea. Some one, who was playing on the piano in the music-room, had drifted into the loved strain of *Home, sweet Home*, and was sending it stealing out over the sea like a benediction. Round the sharp cut-water the spray was rising in a fairy fountain, whose drops rang like a chime of tiny silver bells as they met the waves again. Down in the cool depths a

shoal of fish were playing round the ship's head, looking, as they moved through the phosphorus-laden water, like fish-shaped fragments of solid rainbow gone mad.

Thus I rested and was at peace, until my reverie was broken by the sound of footsteps ascending the forecandle ladder. I turned, and was face to face with my cabin companion, Mr Ralph Stevenson. 'Glorious night, isn't it?' he said.

'Magnificent,' I answered; and then added: 'It's not only the present delight that I am thankful for, but for the memory it will be in days to come; for you know "a thing of beauty is a joy for ever."'

'I don't know about that,' he rejoined; 'it depends wholly on the circumstances under which one has seen it. Do you know this lovely night has called to my mind one of the most unpleasant incidents in my life?'

'Indeed: what was that?'

'Sit down here on this coil of rope, and if you care to hear it, I will tell it as we smoke.'

I gladly accepted his offer, and Stevenson began.

When I was a young fellow, years ago in London, I was in the employ of an uncle of mine who was at the head of a large firm of ship-owners. My health had broken down owing to hard work and a severe season, and the doctor ordered me a long rest and a sea-voyage. The firm at once gave me the required leave, and shipped me off as sole passenger in one of their best trading clippers. We had a fine passage, and arrived safely in the magnificent harbour of Rio de Janeiro. The port was crowded, and we had to anchor outside and wait our turn to be berthed. We lay for some days, during which the heat was intense; when, all unannounced, there burst over the city and the shipping one of those terrible outbreaks of yellow fever that are so common there. The disease spread with fearful rapidity, and soon our ship was one among the crowd lying at the quarantine anchorage and flying the hateful yellow flag.

It was terrible to lie day after day on the glassy sea and watch the doomed city through the haze, and the ships nearer at hand. Constantly the yellow flags were fluttering down to half-mast, as a signal to the shore-boats to come off and take away the bodies for interment. All our crew had deserted at the first, with the exception of the captain; the carpenter, a tall thin Scotchman from the Clyde; and a black cook, named Jacob. These with myself formed the whole ship's company. Suddenly the captain was struck down, and by influence we managed to get him taken off to one of the hospitals ashore. Next day, Chips—as they always call the carpenter at sea—was laid low. Jacob came and told me Chips was in his bunk, very bad, so I went on the maindeck and visited him. I found him raving in fever. We flew the signal for the doctor. After a while he came off, said it was a bad case, prescribed, gave directions as to medicine and disinfectants, and departed. Jacob and I took turns in watching poor Chips. On the evening of the next day I was pacing the poop, utterly weary and sick at heart. The red-hot sun went down at last, and the stars came out. The

night was brilliantly calm and still. The lights on the esplanade of Rio began to twinkle out into the darkness. Far above them on the overhanging terraces, clusters of lights—marking the position of countless villas—hung on the blackness of the steep background like diamonds set in jet. The dim outlines of the huge mountains which rise behind the harbour loomed through the darkness in the faint starlight. The Corcovada and the Gavea could be seen head and shoulders above the rest. Towards the open sea the black form of the Pao de Assacur, which guards the entrance of the harbour, stood like a solemn sentinel. Near it could be descried the glimmering of the light-houses, far away at the heads. I paced the deck trying to fight against a feeling of utter lassitude and depression. I had a terrible headache, a taste like blood in my mouth, and felt aching and feverish all over.

Presently the black cook Jacob came on to the quarter-deck, and touching his cap, said: 'Please, sir, won't you come down and have some tea? It has been ready for half an hour.'

'Thanks, Jacob.—But how is Chips?'

His black face became grave at once as he replied: 'Please, sir, he died nearly two hours ago; but I did not like to disturb you, so I laid him straight and still, tied a handkerchief round his poor thin face, and came away softly and shut the door.' Here the poor fellow's voice broke into a sob.

'Make the flag half-mast, Jacob.'

'No good now, sir; they won't come off till daylight.'

'Oh yes, you are right; I forgot it was dark.'

'But come and have something to eat, sir,' persisted the faithful fellow; 'you must be ready to drop.'

'All right, Jacob; I will,' I answered; and then, as he turned to go, I said: 'Jacob, come aft and have your tea in the saloon. To-night, we may as well keep each other's spirits up.'

'Thank you, sir,' he said, and disappeared.

After a little while, I went down into the saloon; and had the circumstances been different, I would have roared with laughter at the scene which met my eyes. Jacob had undergone quite a transformation, and how he managed it in the time, I was at a loss to guess. He was rigged out in his best suit, and in all the glory of a dress shirt of startling whiteness decorated with diamond studs. He had not seated himself until I arrived, and stood contemplating himself and his surroundings in the mirror over the sideboard, his ebony countenance shining with ineffable satisfaction. All through the meal, his look of self-satisfied importance amused me greatly; but when tea was over, the old feeling of depression returned with renewed force. King Death reigned over the ship, and the majesty and terror of his presence were all around.

'Come into my cabin, Jacob,' said I, 'when you have cleared up, and we will have a smoke together.'

He agreed cheerfully, and I left the saloon. My cabin was under the break of the poop, and had a window looking right on to the maindeck, as well as the usual seaward porthole. Before lighting my lamp I looked out at the quiet ship. The full tropical moon had risen while we were at our meal, and filled the deck and the rigging with

her white radiance. About ten yards from the window stood the deckhouse where the dead man was lying, and the moonlight glittered on its window and the brasswork of the door. While I looked, I wondered, 'Shall I die, too, during this awful visitation?' Then I thought I will just write directions as to what is to be done with my clothes and letters, now while I can.

I sat down at a small table at the other side of the cabin, kindled the little brass swing-lamp, and began to write. I had hardly begun when Jacob knocked at the door, and when I called, advanced into the room pipe in hand. Asking him to sit down, I told him I would finish writing soon. He went over, and sitting at the open window, began to smoke. The night was so utterly still that the scratching of my pen seemed loud and aggressive. Suddenly I was startled by Jacob's pipe going crash on to the floor of the cabin; and looking at him, I saw that his black face had become a light gray colour and that his eyes were starting out of his head. Before I could move or speak I heard the squeak of a door-handle softly turned. I crossed beside the negro, and gazed at the door of the house which contained the dead carpenter. As I looked, my heart ceased to beat, and my hair stood up. The door slowly opened, and out into the bright moonlight came the tall figure of the dead man! It seemed to pause and hesitate for a moment, and then advanced with muffled tread straight to the saloon entrance and my cabin. The moon shone full on the ghastly face, bound about with an old red handkerchief, from which the unclosed dead eyes shone as from under a cowl. On it came, nearer and nearer, while I remained frozen with horror. We heard the soft footstep approach the passage door, and then a heavy fall, and all was still.

At that moment Jacob gave a fearful shriek and fainted. This brought me to my senses; and stepping over the prostrate black, I seized the lamp and hurried out. There lay the ghastly figure across the doorway. I had not been dreaming, then, and it was no fancy. I almost dropped the lamp in my renewed terror. But I braced myself together, and stooping over the body, turned it on its back. As I did so, a faint sigh came from the white lips. I was a man again, and roared: 'Jacob, you idiot, come here; the carpenter is not dead at all.'

Well, my story is out. We carried him back to bed, and nursed him tenderly, and in the morning the doctor came; but we said nothing to him about the performance of the night before. The fact was, Jacob had mistaken the deadly trance of the yellow fever for actual death; and I, being so broken down with watching, had never questioned his statement.

Poor Chips had revived a little, and in the strength of delirium had wandered on deck; and so it all came about as I have told you.—Would you believe it? That carpenter afterwards recovered, and is alive at the present day. The captain, too, got better. Neither Jacob nor I caught the fever; and not many weeks later, we left that accursed place, and were bowling along for dear old England. A soft still night at sea like this always makes me think of that adventure, and I do not relish it even yet.

One—two, three—four, five—six, seven—rang out from the poop. The watch suddenly drops

his musing and answers on the deep-toned forecastle bell. I hop off the coil of rope and remark: 'I say, Stevenson, your wretched story has given me cold shivers all down my back, and I shall have the nightmare every night for the next month. Let us go to the ladies on the quarter-deck and try to forget it.'

He laughingly assents, and we throw our cigars into the sea and join the merry crowd aft.

APT ILLUSTRATIONS.

'SITTING on the fence' is rather a happy Americanism to express the position of politicians who are ready to go back or forward, to jump down on this side or that, as circumstances suggest.

'A scheme to enable the wealthy to spend several hundred pounds for diamonds and dresses in order to raise a few hundred pence for the poor,' is not a bad hit at a charity ball.—A comedy has been wittily likened to a cigar. If it's good, every one wants a box; if it's bad, no amount of puffing will make it draw.

A youngster who saw a steamer for the first time, exclaimed: 'Look! There's a railway-engine having a bathe!'—A locomotive has been called a professional place-hunter, and an underlined article. A school-girl defined a bustle as a 'hollow mockery,' and a boy described a lawsuit as the things a policeman wears.—A little girl was heard to say to her favourite doll: 'You know, dollie, if first you cry and then you smile, a rainbow will come on your face.'—Children have often a happy knack of making apt illustrations. A boy on being asked to describe a kitten, said: 'A kitten is remarkable for rushing like mad at nothing whatever, and stopping before it gets there.' The children at a Sunday school being asked, among other questions, what bearing false witness against one's neighbour meant, a pert little girl replied: 'It is when nobody hain't done nothing, and somebody goes and tells.'

That homely dish, tripe, has been compared to 'a specimen of inferior sponge;' while the useful article the needle has been called a rent-collector.—'The edge of night' is a provincial phrase for just before dark; and an adder is a polite euphemism for one who enlarges upon the truth.—Lies, we are told, are falsehoods that have been found out; gossip means putting two and two together and making five of them.—In the matter of speed there is great similarity between a flash of lightning and a bit of scandal, and it has been truly remarked that an unkind word easily falls from the mouth, but six coach-horses cannot draw it back again.

A small boy's idea of a reporter is summed up in the words: 'Any one who knows a thing before it happens.' One of those imaginative gentlemen in noticing a grocery shop kept by a woman, said: 'Her tomatoes are as red as her cheeks, her indigo as blue as her eyes, and her pepper as hot as her temper.'—More curious was the eulogy of a poetical lover, who, writing to his sweetheart and expatiating upon his affection for her, described his heart as being rolled out flat

like a pancake and folded round hers.—In the fashionable vocabulary, the bride may be described as a peg on which finery of all kinds is hung; the bridegroom, a sober, black object following the bride, of no account in particular, yet without whom there would be no fuss, and the fun could not go on. Matrimony has many similes. To the physician it may appear like an inverted fever, which begins with warmth and ends with chill; to the chemist, a simple affinity; the druggist, a cooling powder; the lawyer, a legal contract; the merchant, a speculation, as often unlucky as not; the poet, a romance which passes through several editions; the actor, a tragi-comedy which is always applauded by the public; the musician, a concert in which love plays the lute, the neighbours the trumpet, and the husband the solo cornet; and finally, to the soldier, matrimony will be a campaign which sometimes extends to a seven years', and sometimes to a thirty years' war.

A certain nobleman once said that social happiness consisted in being asked everywhere and going nowhere. Health, which is such an important factor in our happiness, has been defined as that state in which the body is not consciously present to us; in which it is joy to see, to think, to feel, to be; the state in which work is easy, and duty not over-great a trial; the state in which one goes forward on the journey of life, getting and giving joy. This is the secret of happiness, as we soon find from experience.—What is an apt illustration of a secret? Anything that has been made known to everybody in a whisper.—And what is experience? A poor little hut constructed from the ruins of the palace of gold and marble called our illusions.—A not unhappy illustration of the height of impudence is the calling up of one doctor to learn the address of another.

The ridiculous is memory's most adhesive plaster, and nonsense was well defined by Dr Johnson when he said: 'Sir, it is nonsense to bolt a door with a boiled carrot.'—The same authority, speaking of a quarrelsome fellow, said: 'If he had two ideas in his head they would fall out with each other.'—That obnoxious creature the prig has been defined as an animal who is overfed for its size. Another nuisance, a bore, is thus summed up in rhyme: 'Do you ask me what a bore is? I will tell you who is such; 'tis the one who knows too little, 'tis the one who knows too much.'—A bigot is a man who doesn't believe in allowing other dogs to wag their own tails in their own particular way.—A genius was pithily described by an old lady of great experience as 'a boarding-house keeper—as a man who knows more than he can find out, spills "vittles" on his clothes, and doesn't pay his board regularly.'—The clever wife of a Professor in a Western college once wrote, in one of those confession books where people put down their opinions on all sorts of subjects, in answer to the question, 'What is your idea of a heroine?'—'An educated woman who does her own housework.'

Goethe says of Shakespeare: 'His characters are like watches with dial-plates of transparent crystal; they show you the hours like others, and the inward mechanism also is all visible.'—John Stuart Mill aptly illustrates the difference between Science and Art: 'Science is a collection of truths; Art, a body of rules. The

language of Science is: This is or This is not; This does or does not happen. The language of Art is: Do this; avoid that. Science takes cognisance of a phenomenon, and endeavours to discover its law; Art proposes to itself an end, and looks out for means to effect it.'

Voltaire describes a physician as an unfortunate gentleman expected every day to perform a miracle, namely, to reconcile health with intemperance.—A female doctor has been punningly defined as a woman with a *patient* turn of mind.—An Irishman's idea of a rich man is one who bites off more than he can chew, and a poor man as one who chews more than he can bite off. Allusion to a son of Erin brings to mind the remark of an experienced landlady, who observed: 'I always notice that the Irishmen begin to live on the first-floor, and end in the garret; the Scotchmen begin in the garret, and end on the first-floor.'

Some odd but apt illustrations are the following: 'It is no great credit for the worm to turn when stepped upon, remarks a philosopher: a barrel hoop will do the same thing.'—'Faith is sometimes personified as a drenched female clinging to a sea-washed rock,' says an observer. 'But a better personification would be, a bald-headed man buying a bottle of patent hair-restorer.' Such a simpleton should be classed amongst the 'natural fools' described by Fuller as persons whose heads are sometimes so little that there is no room for wit, and sometimes so long that there is no wit for so much room.

An old judge told a young lawyer that he would do well to pick some of the feathers from the wings of his imagination and stick them into the tail of his judgment.—A servant who plumed himself upon being employed in a genteel family was asked the definition of the term. 'Where they have two kinds of wine, and the gentleman swears,' was the reply.—A curious description of his experience was given by a sailor, who on being asked to explain the difference between a hurricane and a typhoon, said: 'In a hurricane, the wind blows as hard as it can—right straight along; but in a typhoon, just as it is blowing its hardest, it gives an awful jerk.'

American advertisements are often very amusing in their attempts to illustrate aptly the art of puffing. For example a vendor of a new tobacco thus describes it: 'It is like your first love—fresh, genial, and rapturous. Like that, it fills up all the cravings of your soul.' The author of that advertisement would no doubt agree with the statement, that the tradesman who does not advertise liberally has been very appropriately compared to a man who has a lantern but who is too stingy to buy a candle. A man who is neither a free-trader nor a protectionist thus illustrates his charitable feelings towards his neighbour: 'I should like to have a hole in my fence big enough to let my hens get into my neighbour Jones's garden, but too small to allow neighbour Jones's hens to get into my garden.'—An hotel-keeper's idea of a pessimist is a man who would find fault with heaven, if he ever got there.—A humorist explained the meaning of a 'stony glare' to his little son as the expression which comes over a man's face in church when the contribution box is held before him and he has neglected to provide himself with a three-penny piece.'—'Dinah,

why doan you nebber wear white clo'es?' inquired one coloured lady of another.—'White clo'es!' was the reply. 'D'you think I want to look like a fly in a cream-jug?'

THE MONTH: SCIENCE AND ARTS.

ONE of the most remarkable enterprises in the history of geographical discovery has just been brought to a successful conclusion; and although we have not yet received full particulars concerning it, these will doubtless come to hand before long. We allude to Dr Nansen's remarkable journey across Greenland from east to west. The novel point in this journey is that it was undertaken on foot, but the feet were armed with *skydders*, or snow-shoes, which those of our readers who have been to Norway will recognise as the same six and seven feet long runners which are used in that country by sportsmen in pursuing various kinds of game over the snowfields. Dr Nansen happens to be the champion snow-shoe skater of the North, and it was his idea that the adoption of this novel mode of locomotion would solve several difficulties in his way. These anticipations have been realised, for a telegram has arrived saying that the journey has been actually accomplished; but as the last vessel from Greenland had left when the party of explorers arrived at their destination, they will probably be unable to reach Europe until the navigation is again open in the ensuing spring.

Professor Lanza lately read a paper before the Boston Society of Arts upon the important question of Heating Railway Cars. Our readers well know that a great many accidents in America have been intensified in their horrors by cars catching fire from the stoves that are commonly used in that country, and the plan of heating by steam generated by the locomotive is fast superseding the older method. Professor Lanza states that experiments show that a very small percentage of the steam generated by the engine is required for heating purposes. The supply-pipe should not be less than one inch and a half in diameter, and connections between the carriages should consist of rubber tubes. The steam should be used direct, as all attempts to utilise the exhaust from the engine have failed. The greatest difficulty that has been met with in applying this method of heating cars is the condensation which takes place in the pipes; but a method has been found for obviating this by the interposition of suitable traps. An Act of Congress forbidding the use of ordinary stoves in railway trains will presently come into force.

An uncommon accident, but not the first of its kind, is reported in the *Railroad Gazette*. This accident occurred in the Hoosac Tunnel, and was caused by the accumulation of vapours from passing locomotives; no fewer than sixty-nine workmen having been rendered insensible by this means. Luckily, the state of affairs was discovered, and further traffic through the tunnel was at once stopped, otherwise the loss of life would have been considerable, as the men actually were lying across the track. Happily, the victims were rescued in time, and no loss of life was incurred. This accident will serve to remind

Londoners of the risks they incur in a minor degree by travelling underground under present conditions of locomotion. And we believe the Directors of the Metropolitan Railway are fully alive to the necessity of providing some means of driving their trains other than by the steam-engine. Experiments have already been made with compressed-air engines, but there is a likelihood that electricity will eventually be employed for the purpose. Some very costly experiments have already been carried out in this direction upon the Metropolitan Railway, and the Directors, it is said, will shortly meet to come to a decision regarding this very important matter. It is probable that their action will be hastened by the consideration that cheap omnibus fares have tempted a number of their old passengers to take the more agreeable open-air route.

A great deal of correspondence has recently arisen as to the results obtained by the Competitive Examination system, and it is the opinion of most experts that this system fails in bringing the best man to the front. But although a great many condemn the system, they feel that they are not able to suggest anything which will satisfactorily supersede it. We are of opinion that if a Scientific Commission were appointed to consider the whole subject, a series of tests might be arranged which would effectually measure the brain-power of candidates for our different public appointments. The present system of cramming for examinations is certainly altogether wrong, for there are many men who possess the capability for passing a difficult examination, and there their talents cease. On the other hand, many men of higher attainments do not figure well at these examinations, often from nervousness, and also because their talents do not lie in the direction of assimilating knowledge from the close study of books. Still, they may have powers of observation and knowledge of men and things which will make them far more valuable public servants than if they were simply crammed with book-lore. We have already the means of testing the accuracy of sight and hearing by scientific means, and it might be possible to devise instruments which would show in a marked manner the amount of brain-power in different individuals.

In spite of the efforts of many thoughtful people to induce ladies to discard the use of dead birds as ornaments to their headgear, we observe with regret that these sad emblems of slaughter are still worn. A writer in the *Hospital* points out the cruelty of this senseless fashion. He says that most of the birds so utilised are females, and are taken in the nesting season, for at that period the feathers are more soft and beautiful; so that those who are ignorant and cruel enough to adopt these ornaments may be informed that their victim is often the mother of a nestful of helpless young, and that they have been left in the nest to die of starvation. Surely those who are members of what is called by courtesy the 'gentler sex' should not be blind to such a consideration as this.

Although much has been written on the subject of arsenical wall-papers and textile fabrics, it would appear that the custom of employing poisonous colours is by no means a thing of the past. The public analyst of Paddington has recently published some information upon this

subject. He has examined, he tells us, a number of imitation Indian muslins and cretonnes, and he found that twenty-three per cent. of these contained arsenic in an appreciable quantity; the colours in which the poison was found being principally terra-cotta reds and gall-nut browns. He also made experiments with a view to find out at what temperature these fabrics would give off arsenical vapours; but these experiments only gave negative results. In spite of this, he quotes two cases brought to him by medical men, in which well-marked symptoms of poisoning were ascribed to the use of these coloured fabrics; in one of these cases, several work-girls employed in making up the material being taken ill with all the symptoms of arsenical poisoning. He attributes this result to the fact that in the work-room the material was pressed with irons, which had a far higher temperature than that used in his experiments. The same authority also tells us that he found arsenic in a glazed cardboard box of a green colour which had contained chocolate. Without wishing to be an alarmist, he points out that individuals can do little in stopping this wholly unnecessary use of virulent poison, and he very rightly suggests that the law should make the manufacturer answerable for the evil.

In the Report of the United States Forestry Department, crude creosote is greatly recommended for its valuable antiseptic properties. It is shown that it is an efficient poison for both animal and vegetable organisms. But apart from its excellent service as an insecticide, it represents one of the best means of preserving timber. Painted upon wood or metal, it effectually protects both from damp or dry-rot; and if forced into the wood under pressure, it carries its preserving properties to every portion of the substance so treated.

Sir Robert Ball, the Astronomer-Royal for Ireland, in the course of a recent lecture on Comets testified to the useful aid which the Electric Telegraph rendered in the quick notification to the different observatories of the world of the discovery of any of those erratic bodies. He pointed out that in spite of the well-known care exercised by both transmitting and receiving clerks, the technical particulars which gave the exact position of the comet were often rendered unintelligible. To remedy this, a simple and most ingenious code has been arranged, by which the position of the wanderer in space is indicated by a single word. This is how it is done: A certain edition of a standard dictionary is used as a master-key to the code, and a copy of the volume is kept at each observatory. Now, suppose that an observer receives a telegram containing the single word 'Umbrella,' he turns to his dictionary, and finds that this word is found on, say page 143, and is forty-two lines from the top of the page. Translated into astronomical language, this means that a comet has been discovered in the position indicated by 143° 42'. The dictionary is certainly put to a use here that its compiler never anticipated.

A Belgian officer has devised a new form of fort, which will probably cause a revolution in the science of fortification. The particulars of this singular construction we give in a condensed form from a full account which recently appeared in

the French scientific journal *La Nature*. The fort, so far as its outward appearance is concerned, is a huge molehill constructed of concrete, and rising but little above the surface of the ground where it is built. On this mound, but flush with its upper surface, are three armour-clad turrets, each containing two powerful guns; four small turrets which can be moved up and down by hydraulic agency, and which contain machine guns; and finally, three conning turrets, which can be used for general observation, or for electric search-lights at night. The lower part of the fort is burrowed out like a veritable molehill, and contains magazines, provision-rooms, officers' rooms, &c. Entrance to the fort is obtained by means of a passage which is several yards below the surface of the earth, and the length and contour of which are of course governed by local circumstances. The door of this passage is of solid construction, is worked by hydraulic means, and is commanded by the machine guns in the turrets above. Altogether, the structure is as impregnable as it can be made. It has been evolved out of the necessity of providing adequate means of resisting the impact of the huge projectiles now in use, against which old-fashioned fortifications are all but useless.

Professor Spring of Liège has been making some curious and interesting experiments relating to the effect of compression upon metallic powders. With a simple piece of apparatus, consisting of a metal block in two parts, but held together by a removable collar, and a cylindrical rod working in a cavity in that block, any amount of pressure could be brought to bear upon a substance placed within the space indicated. With a pressure applied to the rod of thirteen tons to the square inch, lead in grains was compressed into a homogeneous mass; while by increasing the pressure, the metal was forced out as a thin sheet through the crack which marked the division of the block, the pressure-rod being forced completely into the empty cavity. As we have seen, lead-powder required a pressure of thirteen tons to render it into a solid mass. Tin particles were found to unite in the same manner at a pressure of nineteen tons; zinc required just double that pressure; while aluminum and bismuth yielded at the same pressure. Copper was solidified at a pressure of thirty-three tons to the square inch.

According to *Iron*, the surveyors of a railway which is projected between Kansas City and Mexico have come upon a tract of country which presents remarkable if not unique features. Here is a sea of black volcanic glass which has been chilled during agitation in some long-forgotten era, and which now stands up in crested ridges from ten to twelve feet in height. This mass of obsidian or vitreous stone forms a band about forty miles long, with a width of from one to ten miles. On either side of it the country is of the most barren and desolate description, the soil consisting of nothing but fine white ash. To the north of this lava-stream, the ruins of a city, known to the early Spanish explorers as Gran Guivera, were come upon by the surveying party. These ruins have not often been visited, for they are far out of the usual tracks, and water cannot be obtained within forty miles of their site. The city consists of stone buildings of large size, and has evidently at one time been in the centre

of a dense population. The presumption is that the city was overwhelmed by a violent volcanic outburst, which destroyed its inhabitants and diverted its water-supply.

On the 'Fairy Rocks,' Nova Scotia, certain hieroglyphic characters of very old date have been cut. The markings are about one-sixteenth of an inch in depth, and are cut on a surface of polished slate. The Smithsonian Institution at Washington has sent out an expedition to Nova Scotia to study this strange handwriting on the wall, with a view to discover whether it may lead to anything fresh with regard to the early history of America.

An electrical fire-engine has recently been invented, which certainly seems to have many advantages over the ordinary steamer, provided that the necessary current is at hand to work it. This current can be obtained from tapping the wires which supply street-lamps, or the engine can bring accumulators or secondary batteries with it from the engine-house. With such a motive-power, the engine can be started at once at full speed. It is of less weight than an ordinary steam fire-engine, while it is noiseless and cheap. These are advantages indeed; but until the electric current comes into more common use, we must be content with steam fire-engines. We have an example here of a good invention coming a little before its time.

The *Journal of the Society of Arts* gives a very interesting account of the great industry of Bath, in Somersetshire—namely, the quarrying of the famous Bath stone, which forms such a valuable building material. There are edifices still standing which were built in the early portion of the Christian era of this stone, which is remarkable alike for its warm-toned colour, its durability, and its easy working. Among these old buildings may be named the Roman baths at Bath itself; the Saxon church at Bradford-on-Avon (date 705 A.D.); and Lacock Abbey, which dates from the beginning of the thirteenth century. The stone was used for merely local purposes, until, in 1841, the long Box Tunnel was made by Brunel for the Great Western Railway, when that famous boring revealed the existence of the Box and Corsham beds of stone, which are both valuable and extensive. The so-called quarries partake more of the character of mines, for a heading is driven into the side of a hill where the stone is found, and from that heading stalls are cut on either side. The blocks are taken out as large as possible, and are detached from the parent rock by the use of the pick and wedge.

The St Catherine's Point lighthouse, on the south coast of the Isle of Wight, is now illuminated by perhaps the most powerful electric light which has yet been applied to such a purpose, its luminosity being estimated by the Deputy-master of the Trinity House at rather more than seven million candle-power. The maintenance of such a light requires a powerful dynamo, and a steam-engine to drive it, and at St Catherine's lighthouse these necessary aids are in duplicate, in case of a breakdown. Even the old oil-light which electricity has superseded is kept in reserve, in case, by any unlooked-for accident, it should be needed. This is the fourth English lighthouse which has been provided with electrical gear, the other three being at Souther Point, on the coast of

Durham; at the Lizard, on the Cornish coast; and at the South Foreland, where the Trinity House experiments were carried out a short time ago.

An American inventor has patented an attachment to the ordinary bicycle which will enable that popular machine to be used on snow-covered ground, or even upon ice. The smaller wheel at the back of the machine is enclosed in a shoe, or runner, which slides over the slippery surface, the wheel itself being bound to the backbone of the bicycle. To the driving-wheel are attached at intervals little clamps with projecting flanges, which bite the ice, and so prevent the wheel from racing round without doing any practical work, as the wheels of a locomotive are often seen to do on a slippery rail. These clamps are so arranged as not to interfere with the working of the brake. Bicycling on the ice will probably now become a favourite amusement, should the nature of the coming winter admit of its practice.

We have already, says *Nature*, called attention to the fact that an effort is being made to secure for Bedford College (for ladies), York Place, Baker Street, London, new chemical and physical laboratories. The College has been among the most successful of the institutions which send up graduates to the science degrees at the University of London; but its students have hitherto been severely handicapped by the inadequacy of the laboratory accommodation. The opportunity has occurred of securing fresh building-ground adjoining the College, and plans have been prepared for the proposed additional laboratories. Bedford College is the only institution exclusively for ladies which provides first-class practical instruction of this kind.

Some experiments which have lately been conducted by the Health Board of New York indicate that steam is a far more effective agent in the destruction of disease germs than dry heat. These experiments were made with a view of testing the best means of disinfecting the clothing of fever-patients, the fabrics operated upon being placed in a closed tank. The steam had not any destructive effect upon the fabrics treated, except that in some cases the colours were altered or mixed. The Health Department of New York now collect free of all charge clothing and bedding which need disinfection. The articles are collected in iron cages, which are put bodily into the disinfecting tank, while the key of the locked cage remains in the possession of the owner of the goods.

WHAT LITTLE HANDS CAN DO.

EVERY year the ingenuity and the generosity of countless children are shown in the gift of an abundance of clothing and playthings to the suffering little ones in the hospitals. In hundreds of cases these Christmas presents are the work of their own hands; and it is perfectly amazing the things the little hands can do in cleverness and kindness. Children are in general called thoughtless; but if it comes in one's way to see much of their work for the hospitals, it leaves one a very high and beautiful idea of the amount of heart that is hidden under the thoughtless ways.

For weeks, or rather, indeed, for months before

Christmas the gay heads and the little hands all over the land are busy, in leisure moments, inventing and working out brilliant ideas in the way of toys for the sick and poor in the little cots far away. To give old toys is easy enough, and good too; but to *make* toys—that is the child's triumph. We once heard of a little girl who had no one to talk to and nothing to play with, and who amused herself on her sick-bed by keeping a pebble in a box and rattling it for music. We are past the time when such things could happen; the children's hospitals have been opened; daughters of rich houses undertake to make year by year all the clothing for the child who occupies each cot; and the Christmas supply of toys pours in to make the little ones forget their weariness and weakness.

It will be remembered that the Emperor Frederick when he visited the Throat Hospital saw there a little girl in whom he took a tender interest because her affliction was so like his own. She was recovering after a dangerous operation to the throat, and the voice was beginning to come back again. The Emperor saw her quite happy over a doll, which she was treating with such affectionate care that he pleasantly asked her which was the patient, the doll or herself; and with childlike shyness, she admitted, after some consideration, that she really did not know. Somehow, the presence of this doll takes a great deal of the sadness out of the picture, and puts in comfort and homeliness instead.

The kind little makers of the Christmas presents prepare dolls by dozens and scores; the dolls arrive at the hospital with their hats to one side, or poked down over their staring eyes, and losing their shoes like Cinderella; but they are quickly welcomed and cuddled and put to right by some eager pair of hands; and the doll walks on the bed and makes the poor little patient as happy as if she were a veritable fairy instead of a creature of wax and bran.

But the givers are often ambitious in the toys they design, and, leaving doll-world, they enter the animal kingdom, purchase patterns for elephants, pigs, and rabbits, and make solid and strong beasts with black beady eyes and bone tusks of crochet hook—serviceable companions, that can roll off the bed on to the floor and come up again 'not one penny the worse.'

Ingenuity goes still further. The plain deal box is divided by shelves into floors, enamelled on the outside and papered inside; and there is the shell of the doll's house ready. The floors are stained and varnished: the squares of coloured cloth are tacked down as carpets: the furniture is arranged, and the miniature dolls put in their places; the tiny books are on the bookshelves, the fans and mirrors on the wall; and then the generous maker with the gift complete puts the fund of amusement out of her own hands, and off it goes to make poor children glad for many a day. Other clever young people manufacture dancing figures of card and string, or books with moving pictures—the flower that grows, and the cat that appears and disappears in and out of the chimney. Woollen reins and balls of wool are also sent in large numbers, though it is difficult to see how they can be useful except in convalescent homes. Scrap-books and Christmas cards bring up the rear in immense numbers and variety.

While one admires the goodness of heart that prompts all these presents, if one sees much of them one cannot help wishing that the young givers had always sense enough to keep in mind the state of the receivers. They are sick, and more sensitive than the healthy and strong; therefore the plaything should not be fragile, or it will lead to three minutes of play and half an hour of tears. Again, they mostly cannot run about; hence such a thing as a kite is utterly out of place, and would only suggest a helpless longing for the fields. The best plaything of all is something of the soft and strong sort, like our friend the stuffed elephant, or like the doll for the girls. It must be a toy that can go to bed—though, of course, the more elaborate ones are magnificent in the stages of recovery.

The kindness of children goes further yet, and does not stop with amusing the little patients; the girls in happy homes are learning more and more to prepare clothing for use in the hospitals. These garments ought not to be of fanciful and easily spoiled colours or of very delicate stuffs: they are meant to stand hard wear, and not to trouble the wearers by being ruined in a few days. At the same time, clothing for little children ought not to be of coarse stuff because the children happen to be poor. Nor ought it to be of bad stuff when it is supposed to be given for love. A bad gift is no kindness; and 'a coarse thing—only for a poor child' is quite a mistaken idea, as there is no dispensation by which the baby born poor is provided with a tougher skin than that of little mortals in dainty nurseries.

'Something to do!' is the perpetual demand of young folks; and there is nothing that so delights their heart as an undertaking of their own, to be completed in time with grand results. It is part of education to learn to work and to complete the work. Who that has ever come across it can forget Carlyle's earnest exhortation to *do something, to make something*; doing and making being so much more glorious a thing than any amount of feeling, dreaming, thinking, and talking. He pointed out that in a life of ease and leisure there is little value to the world, and that it is quite a new sensation, a sensation of usefulness and of triumph, when first any one can say that he has turned thought into action, and made or done some one useful thing, no matter how humble it be.

When boys and girls clamour for occupation on wet holidays or winter evenings, would it not be well for them to learn Carlyle's lesson of beginning to be active in the world, and to complete some one useful thing that shall be entirely their own doing and their own gift?

Generosity is also cultivated by this charming custom. Generosity is the perpetual fount of joy, and it is well to begin early to let children find out for themselves that when our own pleasures are scant and transient, there is always possible in this world the grand pleasure of giving joy to some sadder heart. Sometimes in sending their Christmas offerings of clothing or playthings, children write most winning letters. 'I loved making it,' they say in their straight and simple language; or, 'I took great trouble to have it look nice;' and they go on to tell their pleasure in thinking that some other child will rejoice over what they have done.

A third good thing taught by this practice is the habit of perseverance. Whatever a child begins ought to be finished. It is part of the training of the volatile mind to constancy and to the determination necessary for the greater works of life by-and-by. To make a coverlet for a cot is a long work for a child; but how delightful is the first sense of finishing long labour, and how useful it is to have learned that little by little longest labours have an end!

The last grand part of the training given in making these hospital gifts is the most valuable part of all. Whatever political economists may say or do, they can never abolish affliction, helplessness, sickness, or poverty. And while these things remain in the world, the duty of charity will still rank first. The character is hard and imperfect in which it is forgotten; and very beautiful is the mind of man or woman that has learned it from the beginning of life, and in whom it has always grown with the growth, like an instinct or a second nature.

CHINESE MEDICINE.

THE medical art in China is mysterious and empirical. The medical profession is regulated by rules almost the opposite of those which prevail in England. In China the doctor receives a fixed salary as long as his patient is in good health. If the patient falls ill, the doctor's pay is stopped until a cure is effected. In England, a sick person usually tries to assist the doctor by explaining the symptoms of his case. In China, this would be considered an insult to the doctor. The doctor may feel the patient's pulse, examine his skin, and look at his tongue; but he may ask no questions. He is then expected to diagnose the disease from which the sick man is ailing, and to prescribe a remedy. The medicine prescribed is usually very cheap and very nasty; but some drugs are highly priced; and there are certain precious stones which are believed to be of wonderful efficacy in curing diseases. One of these expensive prescriptions consists of very costly ingredients. White and red coral, rubies or jacinth, pearls, emeralds, musk, with one or two earths in special quantities, are crushed into powder, rolled into pills with gum and rose-water, and coated with gold-leaf. This unique medicine is reported to be an infallible cure for smallpox, measles, scarlet fever, and all diseases which arise from blood-poisoning and break out in cutaneous eruptions. The strengthening qualities of this preparation are said to be quite remarkable. The Jesuits, who flourished in China in the early part of the present imperial dynasty, affirm that they have seen men snatched from the last convulsions of death by its judicious use.

Another remedy is called *Kiuchiu*, or bitter wine. This seems to be a strong tonic, and is not really of Chinese origin, as it is supposed to have been brought from India. It consists of spirit, aloes, myrrh, frankincense, and saffron. These are to be mixed, and exposed to the sun for one month, until the fluid becomes clear enough to be used.

The following is a prescription for a Chinese love-potion, but it is understood to be only a

burlesque of some of their ordinary medical prescriptions: Take the pistils of a white peony which has bloomed in the spring—of a white lotus that had bloomed in the summer—of a white poppy that had bloomed in the autumn, and of a white plum-blossom that had bloomed in the winter: of each of these, twelve ounces. The pistils are to be kept over till the vernal equinox of the succeeding year, dried in the sun, mixed into powder, and dissolved in twelve mace-weight of rain, and the same amount of pure dew, hoarfrost, and snow-flakes, all of which must have fallen on a particular day. These ingredients being mixed in equal proportions, they are to be made into pills the size of a dragon's eye, and placed in an old porcelain jar, which is to be buried under the root of a flower. When the love-sick patient feels unwell, she is to dig up the jar and swallow one of the pills in a hot decoction of juniper-bark. The Chinese author has omitted to state what effect is produced by this potion on either the love-sick maiden or her lover. But he proceeds to observe that the same prescription is also good for some cases of toothache; only, he adds, as it takes some time to procure all the ingredients of the remedy, some patients have

been known to die, and others have been cured spontaneously, before they could try its effect.

Under these circumstances, it is not astonishing to learn that the medical profession is held in rather low esteem in China. It is an hereditary profession, which receives few recruits from outside, and therefore prefers to stand on its own ancient ways and traditions.

Volume V. of the Fifth Series of CHAMBERS'S JOURNAL is now completed, price Nine Shillings.

A Title-page and Index, price One Penny, have been prepared, and may be ordered through any bookseller.

A cloth case for binding the whole of the numbers for 1888 is also ready.

Back numbers to complete sets may be had at all times.

The First Monthly Part of the New Volume, issued January 31, 1889, will contain the opening Chapters of a new Novel:

JOHN VALE'S GUARDIAN.

By DAVID CHRISTIE MURRAY,

AUTHOR OF 'JOSEPH'S COAT,' 'VAL STRANGE,' &c.

Also a complete Story by W. CLARK RUSSELL, entitled:

JEREMY YORK.

END OF THE FIFTH VOLUME.

Printed and Published by W. & R. Chambers,
47 Paternoster Row, London, and 339 High Street, Edinburgh.
